AMT 8.27

The following is a list of all changes and updates addressed in AMT 8.27.

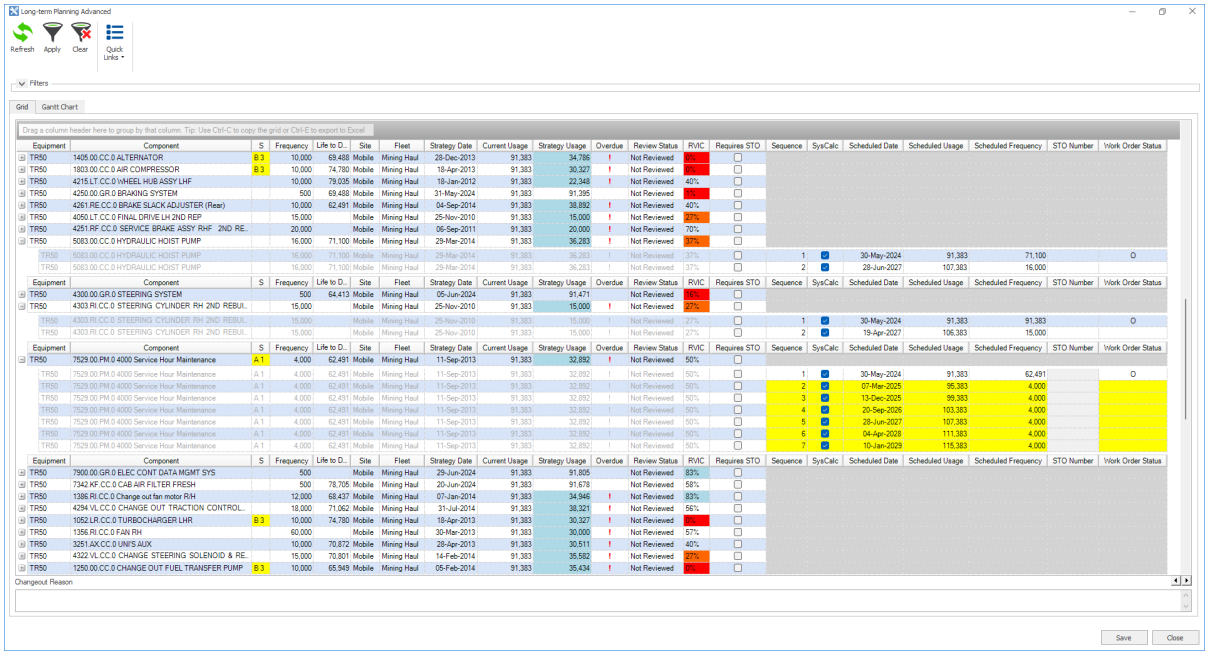

New Features

Better Support for Shutdown Planing

AMT 8.26 saw two main changes in this area; the ability to import Shut windows from an external system and control non-planning tasks. In this release there are further enhancements designed to make the creation and management of shutdown planning simpler and more powerful. They are described below.

Parent / Child relationship

Following up on existing grids such as **Shiftlog** (events and work orders) and **Long-term Planning** (tasks and alerts or measurements) the grid on **Long-term Planning Advanced** now also clearly identifies the parent/child relationship between tasks and occurrences. Users can easily collapse and expand tasks in order to visualise their occurrences.

Easier interaction and shut assignment

You can now tell at a glance whether a field belongs to a **Task** or an **Occurrence**, for example SysCalc sits at the Occurrence level, while Review Status is at the Task level.

We have clearly identified the possible actions a user can perform depending on a number of factors, and ensure the grid gets updated correctly at the right level.

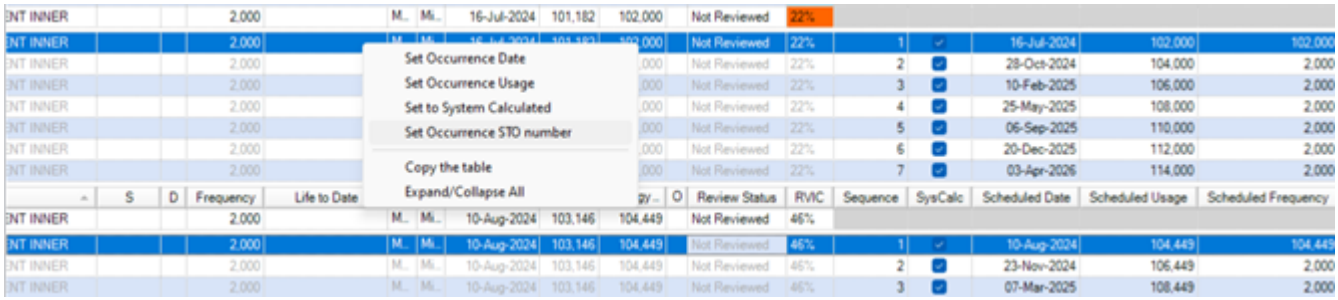

We have also removed the need for individual rows to be selected before they could be assigned to a shut, making the interaction with either structure easier to understand and faster.

Occurrences

The following actions can be performed at the Occurrence level:

- **Multi-Select**
  - Set Occurrence Date
  - Set Occurrence Usage
  - Set to System Calculated
  - Set Occurrence STO Number
- **Single-Select**
  - As above plus Set Occurrence Details.

Occurrences Interaction Example - Assigning occurrences to a shut

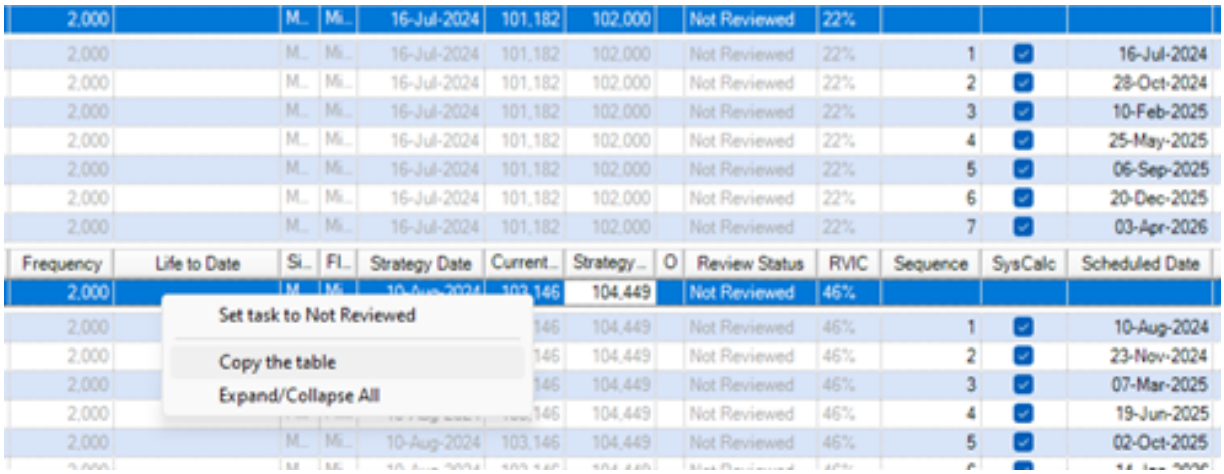

Tasks

The following actions can be performed at the Task level:

- Multi-Selector
  - Set Task to Not Reviewed
- Single-Select
  - Set Task to Not Reviewed
  - Update Last Task Occurrence
  - Equipment Utilisation Analyser
  - Equipment Usage Profile
  - Equipment Actual Usage

Task Interaction Example - Setting multiple tasks to Not Reviewed

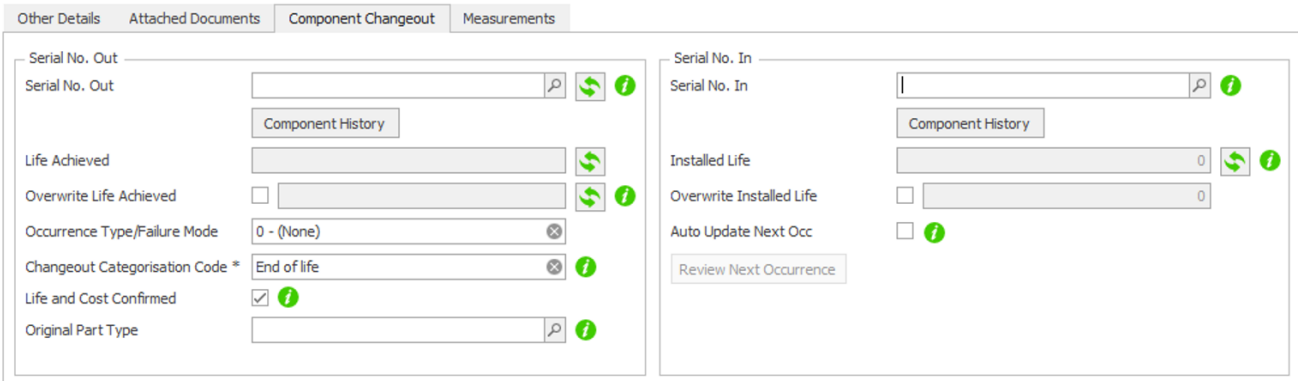

Enhanced Component Rotables management

Another existing module that has been streamlined, with a number of different enhancements.

Easier identification of Serial Number In and Serial Number Out

Fields are now better grouped under a Work Order's **Feedback** tab in order to better identify what applies to the **Serial Number In** and **Serial Number Out**.

More robust calculations

Fields such as **Life Achieved** now cover a wider range of scenarios, ensuring that the system takes into consideration previous installations of a current component.

Similarly, **Installed Life** is also automatically suggested by the system depending on the selected **Serial Number In**, and can then be used to automatically change the next occurrence of the related task.

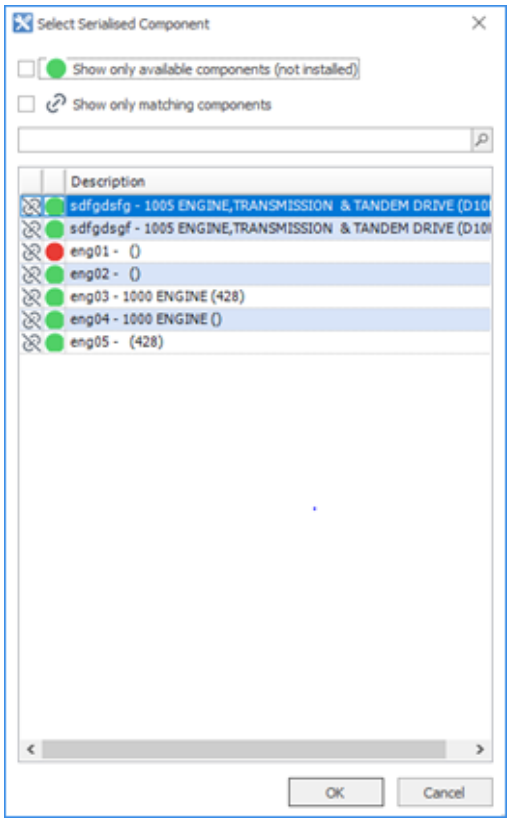

Both fields can be overwritten as needed.

Better control

Previously, the system would allow for any rotables to be assigned to any tasks. System Administrators now have the option of what type of serialisable component a task will handle and pre-define whether a user has the ability to install any rotable, or have the system pre-determine what would fit.

The modes are:

- **Flexible** - Users can choose any rotable component for any task.
- **Strict** - Users will only have access to rotable components that match the following criteria:
    - **Rotable is not currently installed on any other asset** (for example, the last work order that used this component had it under **Serial Number In**).
    - **Rotable matches the task requirements** - The matching is defined at a Global level and can include a mixture of **Model**, **Component Code** and **Part Number**.

Better Reporting support

As stated above, we have catered for a wider range of scenarios to calculate life achieved and therefore next occurrence of selected tasks. We are also exposing these details in the relevant Data Models, along with a new Data Model for a list of available Rotables.

Below are three examples of a possible custom reports that could be written with the available Data Models, two in Power BI, one in SSRS.

Notification App integration

In this release, links to the legacy Notification web page have been replaced with links to the current Notification app. The changed links are:

- **Daily Operations** > **Notifications**

  Opens the Notifications app.

- My **Dashboard** > **Notifications** > **Add**

  Opens the Notification app and allows the creation of a notification.

- My **Dashboard** > **Notifications** > **Edit**

  Opens the Notification app and puts the provided notification into Edit mode.

Enhanced search control

The global AMT search control has been enhanced to support pasting multiple search items from the **Windows Clipboard** . Supported Clipboard formats are lines of plain text separated by:

- Carriage Returns/Line Feed (#13#10)
- Carriage Return (#13)
- Line Feed (#10)
- Tab (#9)

Search control candidates (that is, the list of items on the left of the control) are automatically filtered to contain only entries that match the pasted text. A message is displayed if one or more rows in the pasted text should not be matched.

Performance improvements

Various performance improvements have been made to the Windows Client.

- The technique used by many filters to determine site currencies has been optimised. This can result in significantly faster filter performance across a large number of forms.
- The algorithm used by the Dynamic Lifecycle Costing Calculation (DLCC) has been optimised so that strategy tasks in supression series are now processed more efficiently and quickly.
- The broadcast of work order status changes (integration) has been optimised to only include work orders with an external work order number. This can greatly reduce the number of broadcasts made, reducing load on the AMT server and the integrated ERP.

Security improvements

Various security improvements have been made.

XERAS Enterprise improvements

Three new fields have been added to the **AMT Budget to XERAS Export** feature:

- CostCentreCode
- CostExpenseCode
- SiteCode

AMT Features and Roles function

In previous versions, it was necessary to modify the AMT database to control access to the apps in AMT Web.

In this release, AMT Web uses the existing **AMT Features and Roles** mechanism to control access to its apps, just like any other AMT function.

The following AMT Functions are now available:

- Checklist Template Management
- Checklist Results
- Integration Status App
- Notifications - Create Work Order form.

These functions can be assigned to existing AMT Groups.

Adapters Enhancements

Performance changes

The following methods have had their performance increased;

- ProcessStrategyTaskNextDue()
- ProcessLabourRate()
- ProcessStrategyTask()
- ProcessUsageProfile()
- ProcessWorkOrderGLEntry()

Work Order Adapter

The following optional configuration settings have been added for the Work Order Adapter:

- **ProcessFinancialSummaryProcessThreads**: Number of threads to use when processing financial summaries. Defaulted behaviour when not configured is **2 threads**, which matches the previous behaviour. It is not recommended to increase this without thorough load testing.
- **ProcessFinancialSummaryProcessThreads**: Number of threads to use when updating financial summaries. Defaulted behaviour when not configured is **2 threads**, which matches the previous behaviour. It is not recommended to increase this without thorough load testing.

The Work Order Adapter has been enhanced to support being configured with the HTTPS protocol for **Create ERP Work Order** and **Purchase Order Create Work Order** functions.

The **SendNotification()** function has been enhanced to include the **SiteCode** of the Notification and the SiteCode of the Work Group on the Notification. **Work Order ID** has also been added to allow sending the inspection work order being performed when the notification was raised.

The **SendWorkOrderCompletionComments()** function has been enhanced to include the object part on the work order.

Parts Adapter

The Parts Adapter has been enhanced to support being configured with the HTTPS protocol for **Inventory Lookup** and **Inventory Validate** functions.

Strategy Task Adapter

- **ProcessStrategyTask()** now supports the AMT configuration setting **ImportStrategyTaskUseExternalIdentifier = 2**.
- **ProcessStrategyTask()** now creates strategy tasks with the **Can Move** attribute set to **True**.

Sentinel Adapter

The Sentinel install shield has been enhanced to expose all the configuration settings for credential and endpoints. This removes the requirement to manually edit the configuration file after installation.

Data Model Enhancements

Checklist Results

With the new Conditional Question feature, the data models have also been extended.

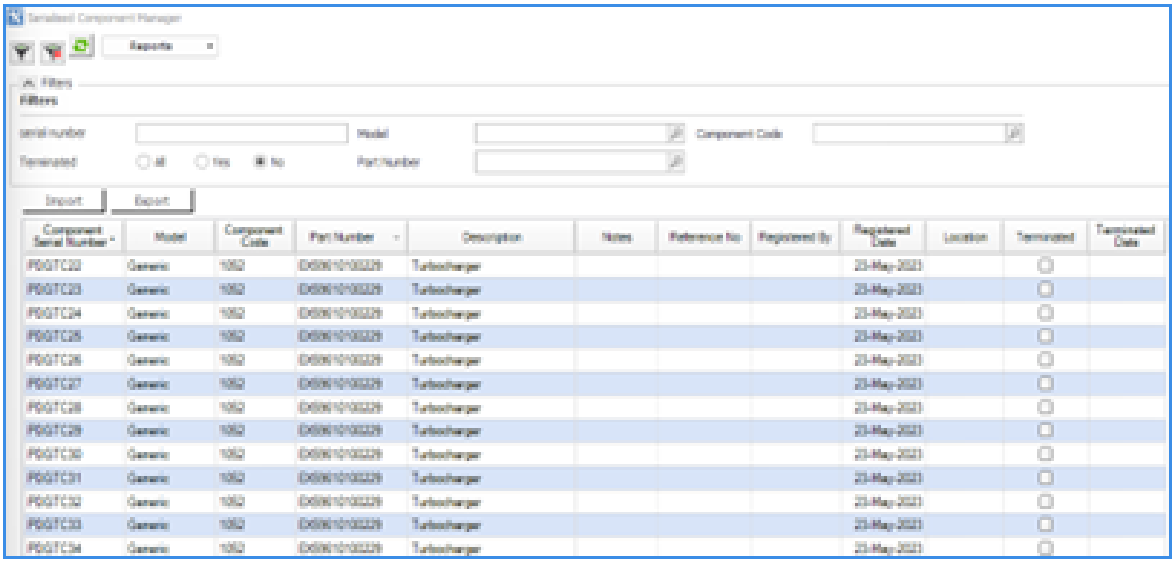

- **ChecklistTemplateSection (Extended)** - A **Section Type Name** column was added to differentiate top-level sections from nested-conditional sections. A new **Key** column was added to link nested-conditional sections with their associated conditions.

- **ChecklistTemplateQuestion (Extended)** - Note that the existing **Checklist Template Section Key** column will continue to refer to the top-level section, even for questions situated within conditions. Three additional **Key** columns have been added that link questions to their conditions, and branching questions. Two additional columns were added to regarding the order of questions and conditions within their parents. Other general question information was added such as Is **Required**, **Allow Attachments** and **Allow Notes**.
- **ChecklistTemplateQuestionCondition (New)** - Returns all conditions defined within all Checklist Templates. Some key attributes include the parent **Branching** question, **Condition Title**, **Condition Type** and **Question Order** within the Parent Question. Some attributes only apply to certain Condition Types, such as **First Operator**, **First Operand** and **List Option Operands**.

Rotable Components

Some additional data is now also available to report writers.

- **[WorkorderDataModel].[WorkorderDetails] (Extended)** - We now hold both the **Serial Number In** and our details, and **Life Achieved** will reflect the changes added to cater for additional scenarios.
- **[WorkorderDataModel].[SerialisedComponent] (New)** - Exposes the details found on the **Serialisable Component Manager**, regardless of whether a work order has used the component to date or not.

Data Mart

Separate Reporting database

A separate Reporting database will be available at the end of June.

This version contains the AMT staging tables and a copy of all the legacy data models converted to indexed reporting tables to replace the prior view methodology. This will allow customers to build SSRS or Power BI reports on legacy data models which previously wasn't possible in large data environments due to performance.

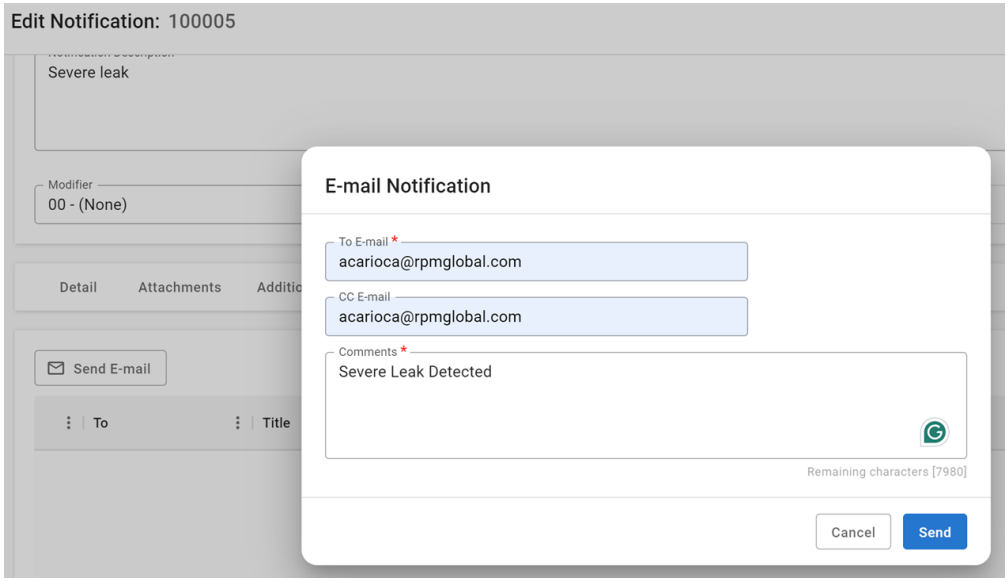

Having the same data models will also allow for the rapid migration of existing reports from the transactional database to the data mart, and also provide much better performance.

A Kimball model (self-service Power BI) will be part of a future release.

Notifications app

Email capabilities

The first version of the **Notifications** app had emailing capabilities. These have been reintroduced on the latest version. Emails with contain details such as **Condition Rating**, **Priority Code**, **Notes** and more.

Languages

Indonesian

AMT now supports **Bahasa Indonesian**. Administrators are able to assign specific languages to different users on the same deployment.

New Fields, Filters and Configuration Options

Rotables

The following fields have been added to the set of database configuration fields. They have a direct impact on **Rotables Strict Mode** – when they are set to 1, the system will look for a match between rotable and task before allowing the rotable to show as a possible candidate for serial number in:

- SerializableComponentMatchingIncludeModelCode
- SerializableComponentMatchingIncludeComponentCode
- SerializableComponentMatchingIncludePartNumber

Fixes

Functional Area	Fix	Work Item	Case ID
Client			
Budget	Fixed an issue where the **Budget Log Service** would crash in some scenarios.	68784	
	Fixed an issue where changes to **Labour Rates** could not be seen in **Budget Change History Report**.	67587	
	Fixed an issue where the **Budget Log Service** would attempt to process up to 10 million history records each time it ran. Depending on the number of unprocessed history records, this could result in an out of memory condition. In this version, the total number of history records processed per cycle default to setting to the appsettings.json file, **MaxRecordsPerCycle**. MaxRecordsPerCycle is an integer value. Assign a number representing the maximum number of records to process per cycle, for example: MaxRecordsPerCycle: 20000. This version of the Budget Log Service can be deployed to AMT 8.22 U1 or higher.	71189	185005
Configuration	In this version, the Windows credentials associated with the reporting sub-system are stored in a more secure manner.	65261	**183602**
Contract Administration	Fixed an issue where deleting a contract could result in an error.	68055	181732

Functional Area	Fix	Work Item	Case ID
Deployment	This release resolves the following deployment issues: • Legacy AMT Web/AMT Mobile Log in page throws exceptions related to missing assemblies. • Legacy AMT Mobile Log in button is greyed out. • KBAs won't resolve the issues reported by health check, type 78 and 80. • IC_ETLServiceUrl always updated to localhost in AMT Configuration Manger.	67872	181592
Depreciation	Fixed an issue where the user cannot select the work order settlement day in the **Monthly Depreciation** dialog.	70061	181657
DLCC	Fixed an issue where invalid overdue strategy task occurrences were linked to an STO/Maintenance Point.	67830	
	Fixed an issue where manually executing a full recalculation did not set calculate usage flags.	61668	
	Fixed an issue where it was possible to link a settlement to multiple work orders.	67386	180380

Functional Area	Fix	Work Item	Case ID
Entra	Added support for sending an email to a configurable recipient when the Entra service creates a new account in AMT. The content of the email is configurable through the use of three new AMT_TYPED_VARIABLE values: • **EmailNewUserSubject**: Email Subject. • **EmailNewUserBody**: Email Body. • **EmailAdministrator**: Recipient email address. **NOTES** 1. All three AMT_TYPED_VARIABLES must exist for the email to be set. 2. **EmailAdministrator** must reference a valid email address. 3. **EmailNewUserBody** supports optional placeholders for the newly created Entra OID of the new user and **{1}** will be replaced with the Entra Identifier of the new user. An example might be: "The AMT Entra sync process has created the following new AMT user: OID: {0} AAD Identifier: {1} This is a system generated message. Do not reply to this email."	69842	
Events	Fixed an issue where the **Actual Hours** of non-primary DTAs could be reset to 0 due to a decimal conversion problem.	67014	180386
General	References to **Customer Care** have been changed to **Customer Support**.	67591	
	Added support for IPv6 IP addresses.	69713	183674

Functional Area	Fix	Work Item	Case ID
Installation	Corrected the default values used by the AMT Configuration Manager for the following settings: • STServerPath • ArchiveWebServiceCall • ExternalPartsBookLookupModelMappingFilePath • UOMFilePath	68764	
Integration	Fixed work order performance issues: • Create ERP Work Order. • Opening work orders from the Planning screen.	67658	179280
	UTF-16 BE BOM is now supported in classic file imports.	67383	
Multi-Task Cost Adjuster	Fixed an issue where the **Multi-Task Cost Adjuster** could raise an exception in certain circumstances.	70146	184094
Parts	Fixed an issue where an exception could occur using the **Add/Updates Parts** feature of the **Interface Administration** dialog.	70611	184434
	Fixed an issue where an exception could occur using the **Add Price** button on the **Parts Manager** dialog.	71232	185087

Functional Area	Fix	Work Item	Case ID
Planning	Fixed an issue where context menu options where not available from the **Long-term Planning Advanced** dialog.	62985	175829
	Fixed an issue where context menu options where not available from the **Long-term Planning** dialog.	68994	182657
	Fixed an issue where it was not possible to choose dates in the future from the **Long-term Planning Advanced** dialog.	65899	180244
	Fixed an issue where unassigning an STO from the **Long-term Planning Advanced** dialog would change the next due date system-calculated tasks.	66921	180571
	Fixed an issue where setting occurrences to be system calculated could display an incorrect error message (but correctly change the underlying data).	66697	180556

Functional Area	Fix	Work Item	Case ID
Planning continued	Fixed an issue on the **Long-term Planning Advanced** dialog where supplying certain filtering combinations could result in an error.	69126	182334
	Fixed an error in **Long-term Planning Advanced** where the **System Calculated** column was appearing in the **Task** area. It now appears in the **Occurrence** area.	71300	
	Fixed an incorrect error message when the user tries to change the **Next Scheduled Date** of an occurrence on the **Long-term Planning Advanced** dialog.	70825	
	Fixed a focus issue where clicking the **Edit Strategy Details** context menu on the **Long-term Planning - Advanced Gantt Chart** didn't return focus back to the correct occurrence.	71207	
	Fixed an issue in **Long-term Planning Advanced** where, if there were system-calculated occurrences, the user could only set the occurrences' **Date/Usage/STO** on the first occurrence.	71031	
	Fixed an issue on the **Scheduling** > **Work Group** dialog where the columns for the per-day option were labelled incorrectly.	70149	184095
	Fixed an issue with **Long-term Planning Advanced** date filtering that could result in some issues not being returned.	65898	180245
Plant Hire	Fixed an issue where creating a new **Project Allocation** in the **Plant Hire** module, the **Start Date** and **End Dates** would default to the dates of the **Previous** allocation. As duplicate allocations are not permitted for the same period, it was not possible to save the new allocation.	67011	180627

Functional Area	Fix	Work Item	Case ID
Reports	Fixed an issue where the **Forecast Availability Analysis** report would not properly warn the user when an equipment had a missing UOM.	70265	184164
	Improved the performance of the **Availability Physical** report.	65877	179305
	Fixed an issue where including a non-ASCII character in any Report filter could result in a message about **Unsafe Search Terms**.	70399	184347
	Fixed an issue where **Projection** filter of the **Changeout Analysis** report was empty.	67757	181352
	Fixed a performance issue with the **Equipment Expriation** report.	68654	182204
	Fixed an issue where an error could occur when running the **Overhead Cost Variance Analysis** report.	71495	
	Fixed an issue where the **Labour Hrs Variance Analysis** report would raise an error if many sites were defined.	71295	
	Fixed an issue where the **Workorder Settlement** interrogation report could raise an error.	71296	
	Fixed an issue where the **Projection Type** filter would not work as expected with the following reports: • RVIC Analysis • Labour Forecast (Dealer Adjusted) • Forecast Worksheet (Dealer Adjusted) • Forecast Worksheet - @Cost	67842	

Functional Area	Fix	Work Item	Case ID
Reports continued	Fixed an issue affecting **Projection** or **Projection Type** filters in the following reports: • Archive Cost Analysis • Archive Cost Worksheet • Cost per UOM - Comparison • Forecast Availability • Maintenance Ratio • What-if - Cost per UOM • Projection and Interval Analysis • Asset Cost Worksheet • Changeout Analysis • Asset Cost Worksheet (LWM)	67766	
	Fixed an issue in the **Planning Status** report that could result in an error when the user selects the **Sort By** filter.	68181	181896

Functional Area	Fix	Work Item	Case ID
Reports continued	Fixed an issue in the following reports where the report was designed to support a date range at the Year/Month level, but the report filter used date pickers to select the range. This was misleading in that users were led to believe that they were supplying a date range, but in reality they were supplying a Year/Month range. The following reports have been modified to display date range controls that use Year/Month: • Site Performance • Site P and L • Billing Interrogation • Billings Reconciliation • Cash Flow Chart • Component Life Distribution • Cost Analysis - To Date • Downtime Analysis • Event Analysis • Labour Hours Analysis • Labour Hrs Variance Analysis • MARC Analysis Of Actuals • MTFS After PM • Service Accuracy • Service Accuracy Variance • Workorder Details • Unassigned Cost Analysis • Unassigned Cost per UOM - by Date • Unassigned Cost per UOM - by Usage • Unassigned Cost per UOM - Comparison • Workorder Settlement Interrogation • Workorder Settlement Interrogation (Cost) • Equipment Cost and Recovery Schedule		

Functional Area	Fix	Work Item	Case ID
Reports continued	• Workorder Settlement Transactions • Planned Workorder Details • Extended Planned Workorder Details	62450	174413
	Fixed an issue in the **Labour Forecast - Hours** report where the labour activity from the Standard Job was not used	36883	146228
	Fixed an issue in the **Strategy Task - Standard Job Details** report where the following values were being incorrectly calculated: • Total Cost • Probability Percentage • Unit Price	39259	152988
	Fixed an issue in the **Summary Analysis - Modelling** report where an error could occur when specifying a **Projection** search filter.	67082	180904
	Fixed an issue where the **PCV Chart** report returned no data when a specific set of filters was supplied.	66960	180464
	Fixed an issue where the **Variance Analysis Worksheet** report could return incorrectly filtered results.	70083	177420
Settlements	Fixed an issue in component life calculations.	69351	182936

Functional Area	Fix	Work Item	Case ID
STO	Fixed an issue where **Assign/Unassign STO** did not always work in Long-term Planning Advanced.	68184	181910
	Fixed an issue where, in **Long-term Planning Advanced** changing an occurrence schedule date to outside of the linked STO's date range did not automatically unlink the occurrence from the linked STO.	68525	182169
	Improved the descriptive text associated with the STO **Can Move** functionality to better reflect the business rules associated with moving STOs	66627	180501
	Fixed an issue where an exception could occur while filtering for STOs in the **Shiftlog** dialog.	67877	181602
Strategy Tasks	Fixed an issue where **Strategy Task** costs linked to fixed priced jobs didn't match the priced job cost if AMT was configured to create Standard Job Expense Allocations.	71222	184975
System Tables	Fixed an issue with the Source system where only one Source could be designated a customer issue.	66618	180548
Time Zones	Fixed an issue where the **TimeZone** dropdown on the **Work Order Editor** screen was disabled even when a user had permissions to select a time zone.	70224	184119
Translations	Fixed an issue where not all potentially translatable strings were translated.	69309	183041
	Fixed an issue in the **AMT Language Editor** where saving a translation longer than 800 characters would fail.		183054
Usages	Fixed an issue where deleting **Usage Steps** when using a regional setting other thank US (English) could result in an error.	70173	183806

Functional Area	Fix	Work Item	Case ID
Work Orders	Fixed an issue where **Planning** work orders were not linking to zero dollar financial summaries.	69114	
	Fixed an issue where work orders could not be opened if AMT was configured in **Work Order Create from PO** mode.	68056	181695
Web			
Authentication	Fixed an issue with Azure AD misconfiguration not being handled correctly during login process.	65156	
	Fixed an issue where users were unable to login with Azure AD authentication.	70896	
	Fixed an issue where AMT Web authentication was failing for specific passwords.	69537	
Catlogue Profile	Fixed an issue with **Cause Codes** not being returned for given profile catalogue ID.	69513	
Checklist Data Model	Resolved an issue where the **AvailableOptions** column in the **Checklist Data Model ChecklistTemplateQuestion** view was always blank.	71325	

Functional Area	Fix	Work Item	Case ID
Checklist Management	Fixed an issue with duplicate data target error displaying when there is no duplicate data target.	71146	
	Fixed an issue when expanding a section would not scroll the checklist results to top.	68011	181681
	Fixed an issue where numeric conditions could not be added to **UOM** and **Measurement** Questions.	70856	
	Fixed an issue where copying an **Archived** Checklist was not working correctly.	71053	
	Fixed an issue when copying an **Archived** Checklist containing **Conditions** and **Custom** Questions resulted in the user not being able to use updated definitions of the Custom Question.	71426	
	Fixed an issue where refreshing the page while having certain **Checklist** App dialogs open forced the user to click the **Cancel** button multiple times to dismiss the dialog.	70812	
	Fixed an issue with the **Save and Close** button being enabled when no options have been selected in a **Checkbox** Question.	71350	
	Fixed an issue where the **Delete** button could be clicked twice causing an error to display.	70913	
Checklist Results	Fixed an issue with the numbering of **Conditional** Question results.	71277	
Checklists	Fixed an issue with the breadcrumb display after changing the language: • The selected **Checklist Template** breadcrumb will still be displayed after a language change. • The selected **Checklist Management** Question breadcrumb will still be displayed after a language change.	66586	

Functional Area	Fix	Work Item	Case ID
Checklists continued	Fixed an issue with a blank apps area being displayed when a user navigates to a non-existent **Checklist Template.**	69143	
	Fixed an issue with a broken link in the **About** page and removed irrelevant data.	70826	
	Fixed an issue where the **Move To** panel was not displaying correctly.	69137	
	Fixed an issue with multi-line **Text** Question answers not displaying line breaks.	68139	181865
	Fixed an issue where the **Component Code** and **Modifier Code** were unaswered from the AMT Mobile **Notification** Checklist, because they were not populating the default Component Codes and Modifier Codes but instead were populating the 00 (0id) ones.	70739	184599
	Fixed an issue where pressing **Enter** in the **Checklist Template** app's **Search** box would reload the web page of **Custom Questions**.	69132	
	Fixed an issue where deletion of a **Question** folder allowed the deletion of **Custom Questions**.	68140	181867
Common	Fixed an issue with security where all apps for the previous privileged user were being displayed in the next unprivileged user's home screen.	67024	
	User Data Grid preferences no longer prevent new columns from being accessible to users for both the **Integration** Status and **Notifications** apps.	67024	
	Text no longer overlaps in the **Settings** dialog.	66747	
	Fixed a performance issue by removing extraneous callouts to some services.	69252	
	Unprivileged user's no longer receive an error when logging out.	68137	

Functional Area	Fix	Work Item	Case ID
Deployment	During the execution of the web installer script, the **Internet Information Services (IIS)** is stopped after validation checks and restarted upon successful completion of the installation process.	68827	
Integration Status App	Fixed an issue where the **Integration Status** app would exhibit odd data grid behavior while moving through pages of data when viewing transaction payload entities with duplicate entity ids.	68921	
	Fixed an issue in the **Integration Status** app where in certain scenarios it was possible that no grid columns where displayed, and empty transaction rows where shown instead.	70029	
	Fixed an issue where the Integration Status **Transaction Action** grid column was missing for users with only Integration Status View permissions.	69740	
	Fixed an issue with the **lastExecuted** attribute always being null.	67067	
	Fixed an issue where unnecessary calls to the service layer were being performed when selecting filters.	66596	
	Creating **Notifications** and **Work Order** links now work correctly in the Integration Status app.	69343	
	When opening a new page of **Payload** details, the page now opens at page 1 of the details.	69344	
	Fixed an issue where an incorrect date was being displayed when no retry date existed.	70294	
	Links from the **Integration Status** app to **Work Orders** are now working.	69342	
	Fixed an issue where error messages were not being displayed in the **Results Summary** grid.	66783	

Functional Area	Fix	Work Item	Case ID
Localisation	Fixed an issue where all **Date Picker** and **Date Range Picker** input fields disregarded the user's current language and locale settings, and instead always used the Browser's default language and locale.	68898	
Navigation	The rail menu now displays strings in the chosen language.	66590	
Notifications	Fixed an issue with the **Create Work Order** button when text, due to another language selection, is too long and does not show correctly. The button with display with an ellipses when the label is excessively long.	66744	
	Fixed an issue where **Notifications** opened from within AMT Client could be shown in a confusing sequence order within the Notification **View** or **Edit** web page.	70200	
	An incorrect **Date Required** is being displayed in the **Notification** screen when the field is left blank while creating a Notification.	67576	
	Fixed an issue where the incorrect date on a created Notification was used.	68301	180183
	Fixed an issue where new columns, **Planning Group** and **Work Group**, were showing by default. These are now only visible when the user sets these columns to be visible.	66577	
	Fixed an issue where the **Notification status** was not being updated to **Closed** after the user has clicked the **Complete Notification** button.	71215	
	Fixed an issue where the **Create** and **View Notification** results in a perpetual loading dialog.	70118	

Functional Area	Fix	Work Item	Case ID
Work Orders	Fixed an issue where **Create_By_User_ID** and **Last_Mod_By_User_ID** are incorrectly set to zero when attaching new Work Order documents.	67125	
	Fixed an issue where work order operation long text and operation instructions were getting wiped whenever a work order update was being processed or synced from AMT Mobile.	68662	182182
	Fixed an issue with processing incoming work order updates from AMT Mobile that would result in the following error appearing in the mobile service logs: **Could not locate the Work Order with work orderId - 0**.	68808	183367
Adapter			
Adapter Request Processor	Fixed an issue where transient errors (such as the database server being temporarily unavailable) would leave requests in the Processing state. In this version, two new AMT_TYPED_VARIABLE settings can be used to configure a retry count and delay between retries when transient issues occur. • **RetryDelayMilliseconds**: Delay in milliseconds to wait before retrying when an issue is detected. • **MaxRetryCount**: The maximum number of retries attempted before the payload fails. If these settings do not exist, the following defaults are used: • **RetryDelayMilliseconds**: 750 • **MaxRetryCount**: 3	70716	184563
	Fixed an issue where the **Request Processor** did not support the full set of Asset attributes when processing **ProcessAsset** requests.	71058	

Functional Area	Fix	Work Item	Case ID
CreateWorkOrder	Fixed an issue where the Reservation number attribute was not being validated for length in **Createworkorder()** and **Updateworkorder()**.	67083	
Events	Fixed an issue where the component code of primary work orders was set to the default component code when the adapter closed the event. The primary work order now retains its component code when the adapter closed the event.	67012	180854
ProcessCatalogueProfile	Fixed an issue where the response data area did not include responses for all requests when duplicate codes appeared in the request.	67262	
ProcessCostCentre	Fixed an issue where **ProcessCostCentre()** would fail if an **Organisation Code** was not supplied.	67853	181553
ProcessDowntimeEvent	Fixed an issue when processing a downtime, if a default unallocated downtime variance was configured, manually entered actual downtime allocations were set to zero. In this release the adapter uses default responsibility codes when not provided in the request message.	70297	182899
ProcessFinancialSummary	Fixed an issue where **ProcessFinancialSummary** would fail if a request referenced an asset that does not exist in AMT. In this release, the request is still processed, but no asset is linked. The asset will eventually be linked by the system when the asset is eventually created.	67913	181580
	Fixed an issue where, in come cases, the settlement date is different to the event downtime.	69466	182879

Functional Area	Fix	Work Item	Case ID
ProcessPartPrice	Fixed an issue where calling **ProcessPartPrice** with a payload containing duplicate part/currency/price combinations would fail. In this release, the duplicates are ignored.	67530	
	When the user uses **ProcessPartPrice()** to create multiple part price entries with duplicate IDs, the response message will use the format **request IDs + GUID** for any duplicates.	67531	
ProcessSTO	Fixed an issue where a **ProcessSTO()** payload with a value in **AMTUserLoginID** which does not exist in AMT would result in a technical error.	68134	
ProcessStrategyTask	Fixed an issue where calling **ProcessStrategyTask** with a payload containing two or more strategy tasks sharing the same external identifier or set of four codes (for the same asset) would cause the entire payload to fail.	68695	182284
	Fixed an issue where **ProcessStrategyTask** was throwing a **Primary key violation** error when there were two strategy tasks with the same codes in a payload.	68931	
	Fixed an issue where **ProcessStrategyTask** would fail to load records with Models that contain a trailing space.	67866	181573
	Fixed an issue where **ProcessStrategyTask** would raise the error **The table-value parameter @StrategyTaskIds must be declared with the READONLY option** for all payloads linking the strategy to a standard job.	68128	
ProcessUsageProfile	Increased the timeout applied when calling **ProcessUsageProfille()**.	67609	

Functional Area	Fix	Work Item	Case ID
ProcessWorkOrder GLEntry	Greatly improved the performance of **ProcessWorkOrderGLEntry()**.	70639	184477
	The **FinancialPeriodMonth** attribute in **ProcessWorkOrderGLEntry** interface has been modified to accept numbers in the range **[1...12]** in addition to the currently working format **--MM**.	67971	181685
SendWorkOrder	Fixed an issue where the Sentinel process **SendWorkOrder** function could raise an Object Reference error.	71455	

AMT 8.26.3

The following is a list of all changes and updates addressed in AMT 8.26.3.

New Features

.NET 8 Support

The following server-side components have been updated to use .NET 8:

- AMT Services
- Adapter Request Service
- Entra User Account Sync Service
- Budget Log Service
- Generic Interface Log Service

Updated Server Prerequisites

The following Microsoft .NET 8 Runtime packages must be deployed to AMT servers where these components are installed:

- ASP .NET Core Runtime 8.0.5+ Hosting Bundle
- .NET Desktop Runtime 8.0.5+

These prerequisites are available from the official Microsoft .NET 8 download page:

https://dotnet.microsoft.com/en-us/download/dotnet/8.0

Entra Account Sync Email Support

The Entra Account Sync service has been enhanced to support the optional sending of an email to a configured recipient in response to a new AMT user account being created.

Configuration

The following new AMT_TYPED_VARIABLES have been defined to support configuration of the email sent.

EmailAdministrators

Email address of the person who will receive the email when a new user is created in AMT. If this setting is not configured, no email will be sent.

EmailNewUserBody

The body of the email that will be sent to the Administrator when a new user is created in AMT. The body contains the OID and the AAD Identifier of the AMT User. These are designated using the {0} and {1} tokens respectively.

An example might be:

"AMT Entra Sync has created a new user with the OID {0} and Login Name {1}"

If this setting is not configured, no email will be sent.

EmailNewUserSubject

The subject of the email that is sent to the Administrator when a new AMT User is created.

An example might be:

"A new AMT user has been created via Entra Synchronisation"

If this setting is not configured, no email will be sent.

Fixes

Functional Area	Fix	Work Item	Case ID
Adapters	Changed the **UpdateWorkOrder()** function to respect the existing configuration setting WOInterfaceUseTimesheetForWorkorderLabour. These are the options for WOInterfaceUseTimesheetForWorkorderLabour: 0 - **Update Labour in Workorder Import**. Under this option, actual labour hours are updated via the UpdateWorkOrder() function. 1 - **Ignore Labour from Workorder Import**. The option to ignore labour is enabled only if ManualEntryActualsLabour=1 or ManualEntryActualsLabour=2. Under this option, actual labour hours are not updated via the UpdateWorkOrder() function.	70219	
AMT Services	Fixed an issue where the IP address associated with AMT service calls could exceed the allowable length when AMT Services were installed on a server other than the application server.	69627	183674
AMT Web Client	Fixed an issue where, under rare circumstances, passwords with a specific sequence of characters could not be authenticated against.	70115	182611
Components	Fixed an issue where component life may not be calculated correctly.	69559	183674

Functional Area	Fix	Work Item	Case ID
Reports	Fixed an issue where the performance of the **Availability Physical** report was poor when using an Equipment filter.	70067	179305
	Fixed an issue where the performance of the **Equipment Expiration** report was very slow.	70112	182204
Work Orders	Fixed an issue where some settlements could have incorrect settlement dates and incorrect usages. This issue also caused issues with associated strategy tasks appearing as DUE.	69579	182879

AMT 8.26.2

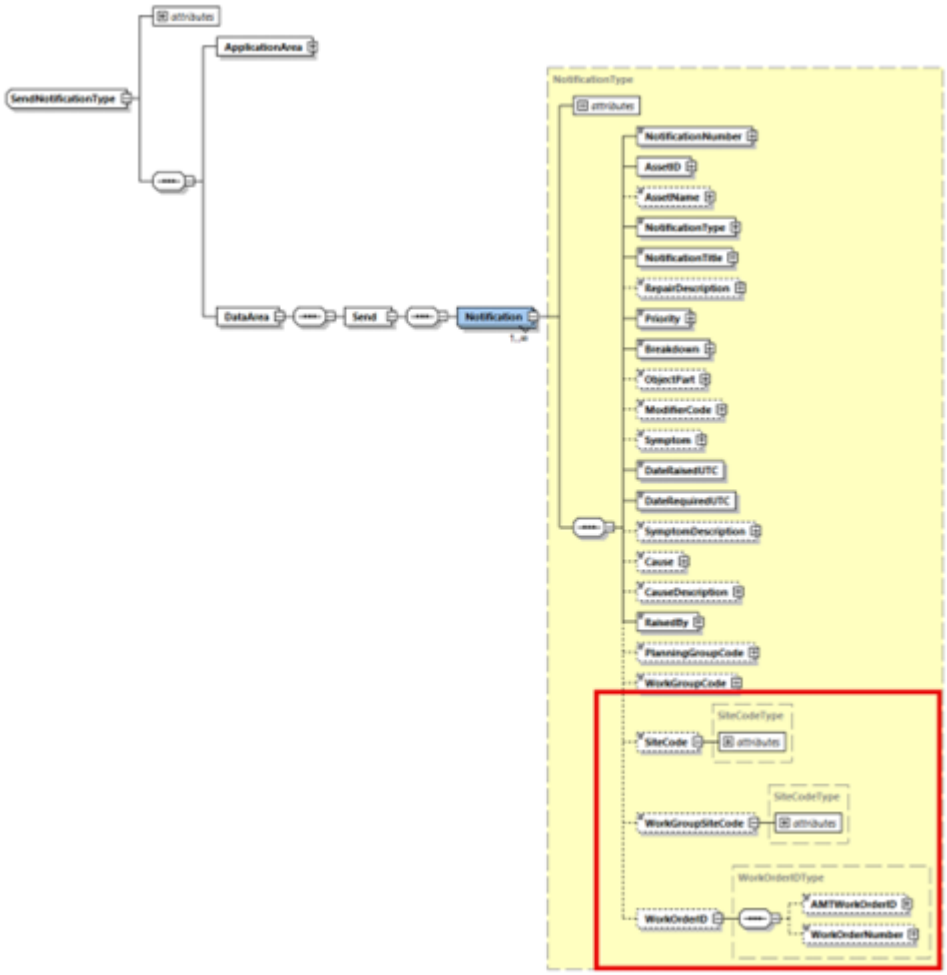

The following is a list of all changes and updates addressed in AMT 8.26.2.

New Features

AMT Adapters Send Notification Message Extensions

The **SendNotificationType** integration message has been extended with the following new attributes:

- SiteCode
- WorkGroupSiteCode
- WorkOrderID

These new attributes are typically used by AMT4SAP customers.

This change requires changes to the following software components. All of these components need to be deployed for the new attributes to be populated:

- AMT 8.26.2
- AMT Adapters 8.26.2
- Zen Services 8.26.2

AMT 8.26.1

The following is a list of all changes and updates addressed in AMT 8.26.1.

From this release onwards, release notes will include AMT EPF Adapters.

Fixes

Functional Area	Fix	Work Item	Case ID
Adapters			
	Fixed an issue in the **ProcessUsageProfile()** where an Event component code and task type code would be set to default values if component code and task type code were not provided in the request.	67848	
	Fixed an issue in the **ProcessFinancialSummary()** function where financial summary payloads referencing an invalid asset would fail. In this release, payloads with invalid assets return a warning message but will still be processed.	67917	181580
	Fixed an issue where some message classes were being processed on the normal queue (which supports asynchronous message processing) instead of the standard synchronous queue.	68349	182055
	Fixed an issue where the timeout used by the **ProcessUsageProfile()** function was not configurable. The default timeout was too short and, in come cases, could result in a timeout.	67659	
	Modified the **ProcessWorkOrderGLEntry()** function so the **FinancialPeriodMonth** attribute accepts numbers in the range **[1...12]** in addition to values formatted as **--MM**.	67982	181685

Functional Area	Fix	Work Item	Case ID
	Fixed an issue in the **ProcessStrategyTask()** function where the following error could be reported when the supplied payload defined a linked standard job: **The table-value parameter '@StrategyTaskIds' must be declared with the READONLY option**.	68177	
	Fixed an issue where the **Actual Hours** of non-primary DTA's were reset to **0** due to a decimal conversion problem	68866	180386
Client			
Budgets	Fixed an issue where changes to budget labour rates were not being seen in the **Budget Change History** report.	67762	
DLCC	Fixed an issue where overdue next occurrences linked to maintenance points/STOs were not being deleted.	67834	
	Fixed an issue where manually executing a full recalculation did not set calculate usage flags.	69101	
General	Fixed the following deployment issues: • Legacy AMT Web/AMT Mobile Login page complained about missing assemblies. • Legacy AMT Mobile Login button was disabled. • IC_ETLServiceUrl would default to localhost in the AMT Configuration Manager.	67905	181592
Long-term Planning	Fixed an issue where AMT displays the error: **The occurrence you selected cannot be set to system calculated. There are occurrences manually set after this occurrence** when changing occurrences to be system calculated.	67927	180556

Functional Area	Fix	Work Item	Case ID
Reports	Fixed an issue where the Projection Type filter was not working in the following reports: • RVIC Analysis • Labour Forecast (Dealer Adjusted) • Forecast Worksheet (Dealer Adjusted) • Forecast Worksheet - @Cost	67855	
	Fixed an issue where an exception would occur when selecting the Sort By 1 and Sort By 2 filters in the **Planning Status** report.	68249	181896
Shiftlog	Fixed an issue where filtering for an STO in **Shiftlog** would result in an exception.	67895	181602
Work Orders	Fixed a performance issue where opening or creating a work order in the Windows client could be slow under specific data conditions.	68741	68741
	Fixed an issue where work orders could not be opened if AMT was configured in **Work Order Create from PO mode**.	67958	
Web			
Checklists	Fixed an issue in the **Checklist Results App** where expanding a checklist section would not scroll the checklist results into view.	68108	181681
	Fixed an issue in the **Checklist Results App** where multi-line text question answers were not being displayed with line breaks.	68195	181865
	Fixed an issue in the **Checklist Management App** where it was possible to delete a folder that contained sub-folders that contained Favourite questions.	68190	181867
	Fixed an issue where under specific circumstances a deadlock condition could occur while editing checklists.	68303	179884

Functional Area	Fix	Work Item	Case ID
Notifications	Fixed an issue in the **Notifications App**, where the notification **Date Raised** the date and time was not displayed using the correct locale. Fixed an issue where Date Required By was displaying date and time. In this version only the date is displayed.	68327	

AMT 8.26

The following is a list of all changes and updates addressed in AMT Version 8.26.

New Features

IMPORTANT: 64-bit Windows Client

The AMT 8.26 Windows Client is now a 64-bit application (previous versions were 32-bit). 64-bit applications can access significantly more memory and work better with modern CPUs than 32-bit applications.

The AMT 8.26 Windows Client will only work on a 64-bit version of Windows.

IMPORTANT: SAP Crystal Reports Runtime Engine for .NET Framework (64-bit)

As the AMT 8.26 Windows Client is 64-bit, customers are now required to download and install the **SAP Crystal Reports Runtime Engine for .NET Framework (64-bit)** to run AMT reports that use SAP Crystal Reports technology.

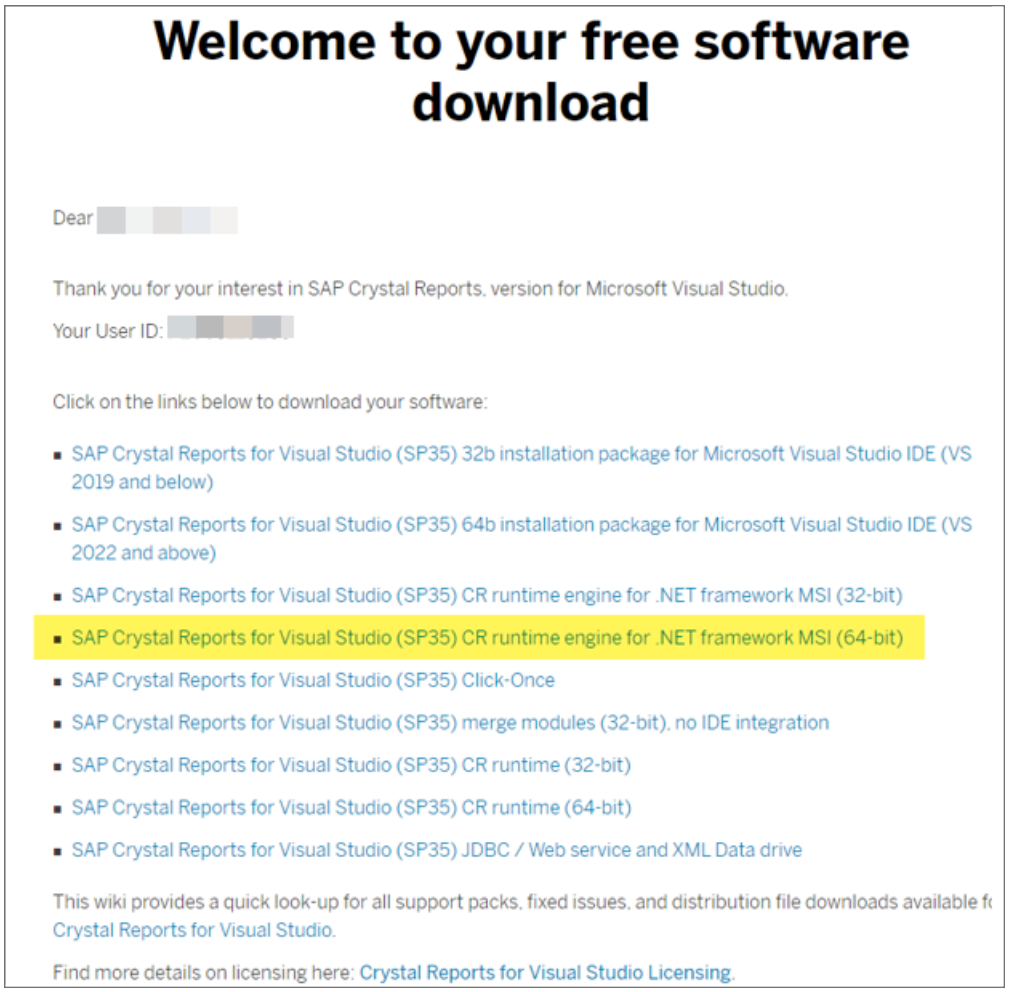

RPMGlobal is unable to distribute the free SAP Runtime. Customers must obtain a copy of the free runtime from SAP and deploy it themselves.

The runtime is available from:

https://www.sap.com/products/technology-platform/crystal-reports.html#visual-studio

Customers are required to create a free account with SAP to access the download. This is a one-off step that will typically be done by a customer's IT department.

Once an account has been created, and the list of available downloads is presented, ensure the **SAP Crystal Reports for Visual Studio (SP35) CR runtime engine for .NET Framework MSI (64-bit)** is downloaded.

Welcome to your free software download

Dear [redacted]

Thank you for your interest in SAP Crystal Reports, version for Microsoft Visual Studio.

Your User ID: [redacted]

Click on the links below to download your software:

- SAP Crystal Reports for Visual Studio (SP35) 32b installation package for Microsoft Visual Studio IDE (VS 2019 and below)
- SAP Crystal Reports for Visual Studio (SP35) 64b installation package for Microsoft Visual Studio IDE (VS 2022 and above)
- SAP Crystal Reports for Visual Studio (SP35) CR runtime engine for .NET framework MSI (32-bit)
- SAP Crystal Reports for Visual Studio (SP35) CR runtime engine for .NET framework MSI (64-bit)
- SAP Crystal Reports for Visual Studio (SP35) Click-Once
- SAP Crystal Reports for Visual Studio (SP35) merge modules (32-bit), no IDE integration
- SAP Crystal Reports for Visual Studio (SP35) CR runtime (32-bit)
- SAP Crystal Reports for Visual Studio (SP35) CR runtime (64-bit)
- SAP Crystal Reports for Visual Studio (SP35) JDBC / Web service and XML Data drive

This wiki provides a quick look-up for all support packs, fixed issues, and distribution file downloads available f
Crystal Reports for Visual Studio.

Find more details on licensing here: Crystal Reports for Visual Studio Licensing.

The AMT Windows Client needs to be restarted after the SAP Crystal Reports Runtime Engine for .NET Framework (64-bit) is installed.

IMPORTANT: Classic file import and export encoding

AMT 8.25 introduced UTF-16 (LE BOM) as the default encoding for classic file integration. UTF-16 provides support for extended character sets. This broke integration for some customers that upgraded to 8.25 and relied on ASCII file encoding.

In AMT 8.26, a new config in the **AMT_TYPED_VARIABLE** table is provided to control the default bahaviour:

Name: ImportExportFileUsingASCIIEncoding

Type: Boolean (0 or 1)

Default: 0

- If ImportExportFileUsingASCIIEncoding = 1 then classic file interface supports ASCII encoding only, that is, the default behavior of AMT prior to version 8.25.

- If ImportExportFileUsingASCIIEncoding = 0 then classic file interface supports UTF16 (LE BOM) encoding only.

New configuration options

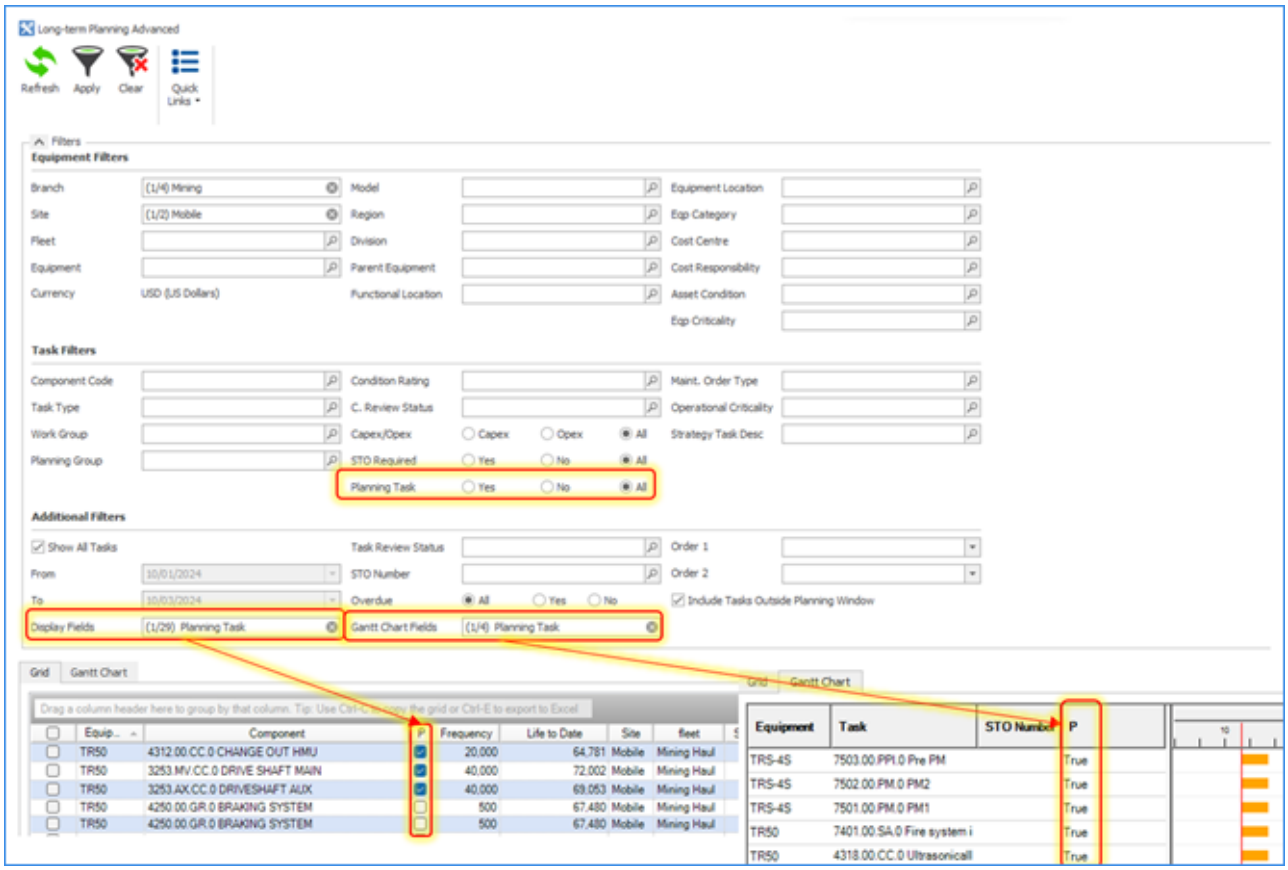

AMT solution designers and those involved in the deployment of AMT should be aware that AMT 8.26 introduces several new settings. See the **M310 Configuration Document** for details.

Support for Non-planning Tasks in Long-term Planning

This update significantly broadens the scope of Long-term Planning (LTP) Advanced by incorporating Non-Planning Tasks.

A new filter, **Planning Task Yes/No/All** has been added to the Task Filters group. The default setting is **Yes**.

Additionally, **Planning Task** is now included in the **Display Fields** options.

Additional Notes:

The **Include Tasks Outside Planning Window** filter is not applicable to non-planning tasks, ensuring focused and relevant data presentation.

Fixed Confirmed Occurrences

AMT 8.26 improves the stability and reliability of the AMT4SAP solution by ensuring that confirmed task occurrences remain fixed.

To achieve this, the **Update Next Occurrence** adapter has been refined to recognise and respect locked occurrences (set to confirmed). It will now provide a notification (Generic Interface log) if an attempt is made to modify a confirmed (locked) occurrence.

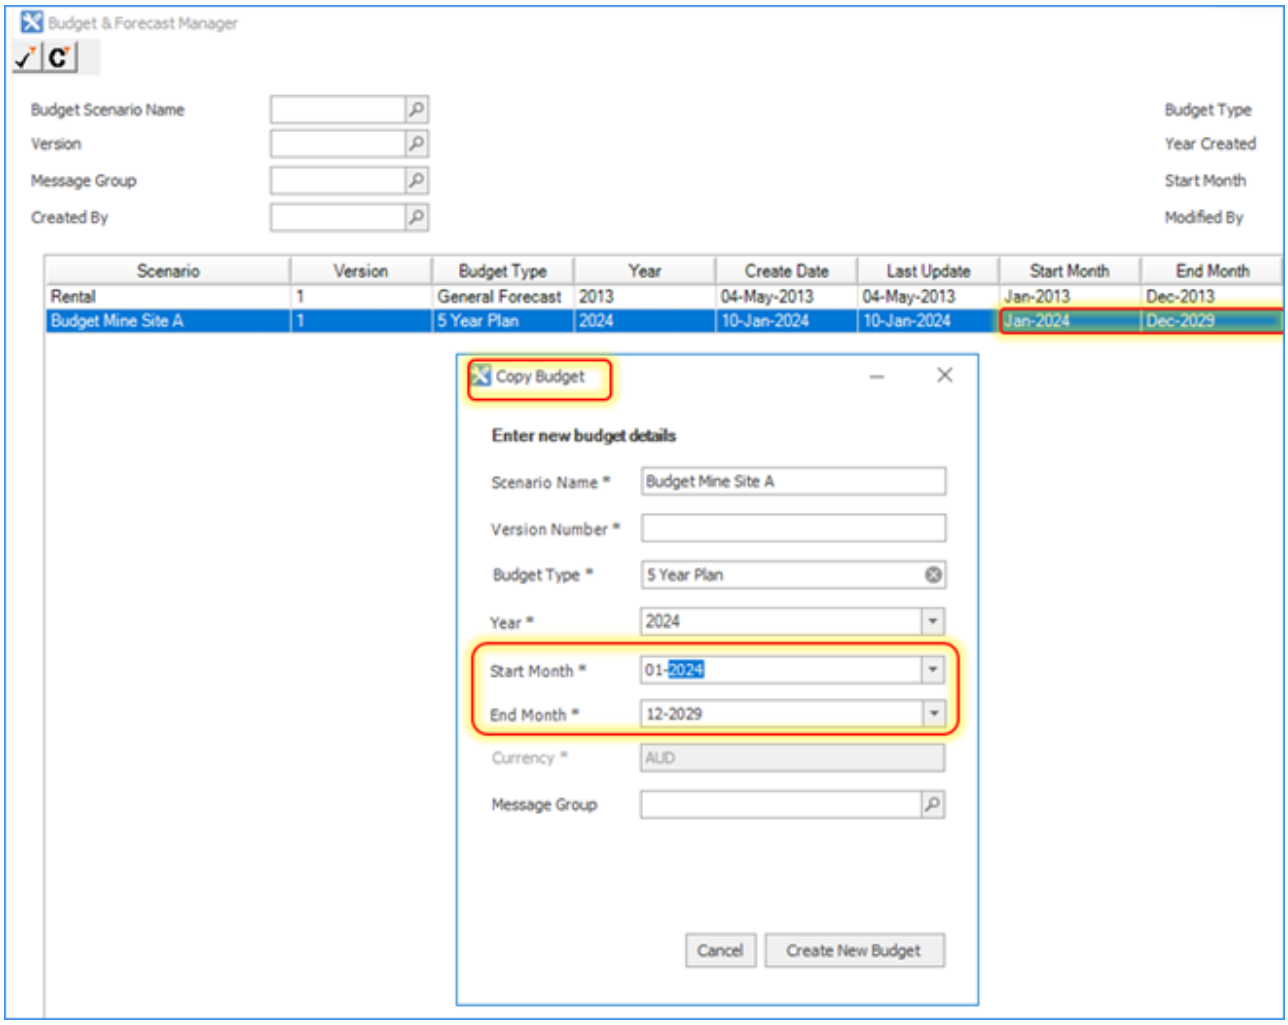

This change enhances the integrity of LTP processes within the AMT4SAP environment, ensuring that manual confirmations by those with the right access are not inadvertently overridden by the adapter description.

See the AMT Adapter release notes and SDK for more information.

Copy Budget improvements

AMT 8.26 provides enhanced flexibility in budget management by allowing modifications to copied budget details, especially focusing on date range adjustments.

Users can now edit header fields of a copied budget, including the ability to select a subset of the original budget's date range. This ensures that budget adjustments remain within the confines of the initial budget's timeframe, while allowing for "reforecasts" to represent just a "slice" of the original baseline budget.

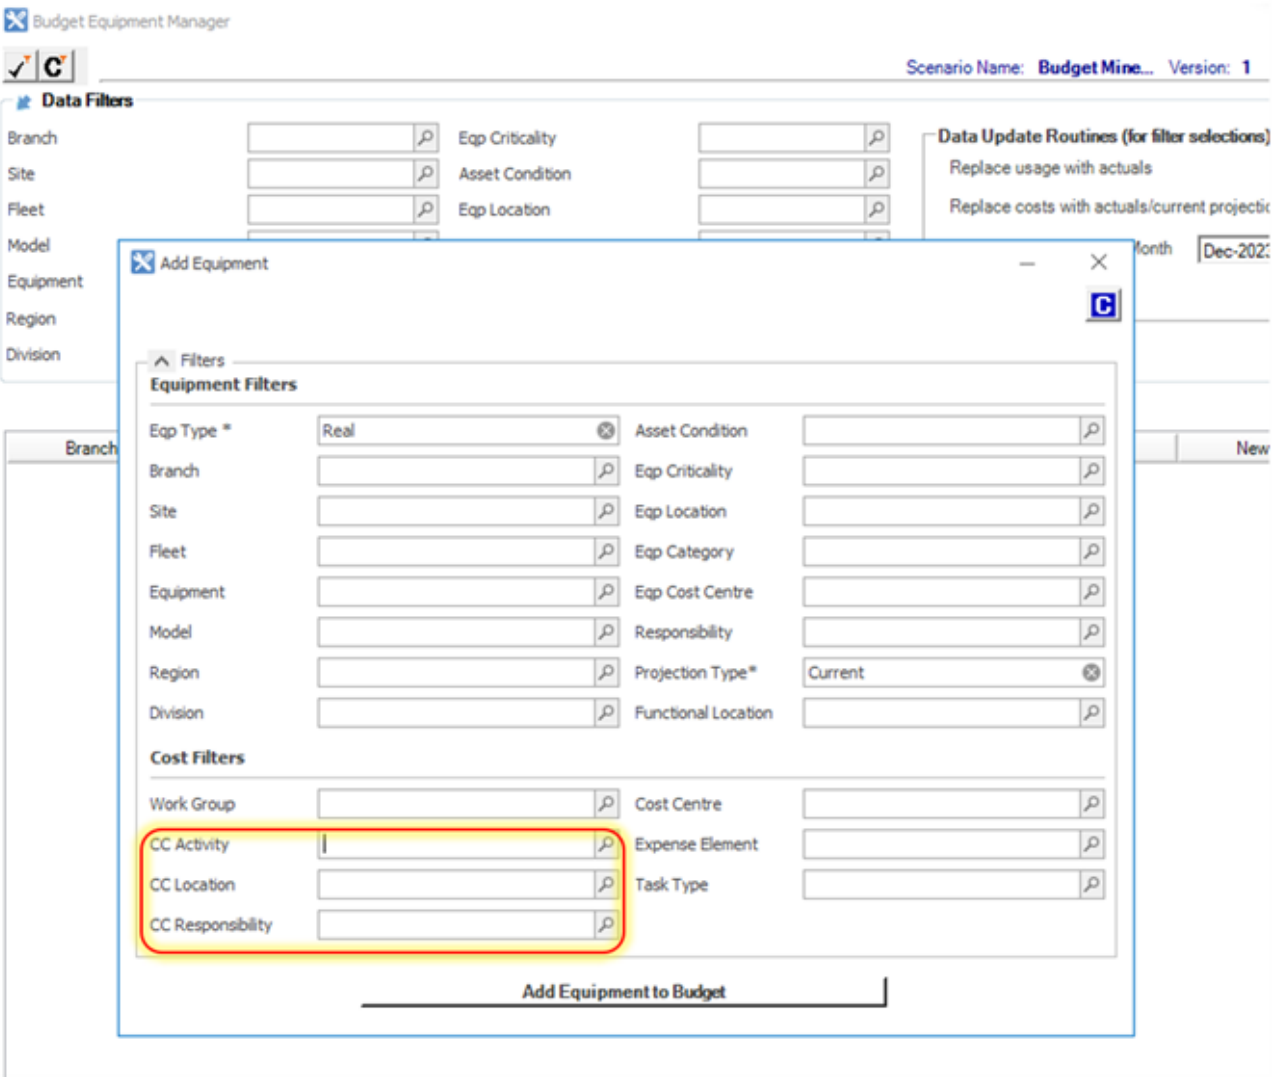

Additional Notes:

Currency details remain fixed to maintain consistency in financial reporting.

Adding Assets to Budget improvements

AMT 8.26 streamlines the process of adding assets to budgets by leveraging **cost centre groupings**.

The **Add Equipment** form and process has been extended to include new filters (**CC Activity**, **CC Location**, **CC Responsibility**).

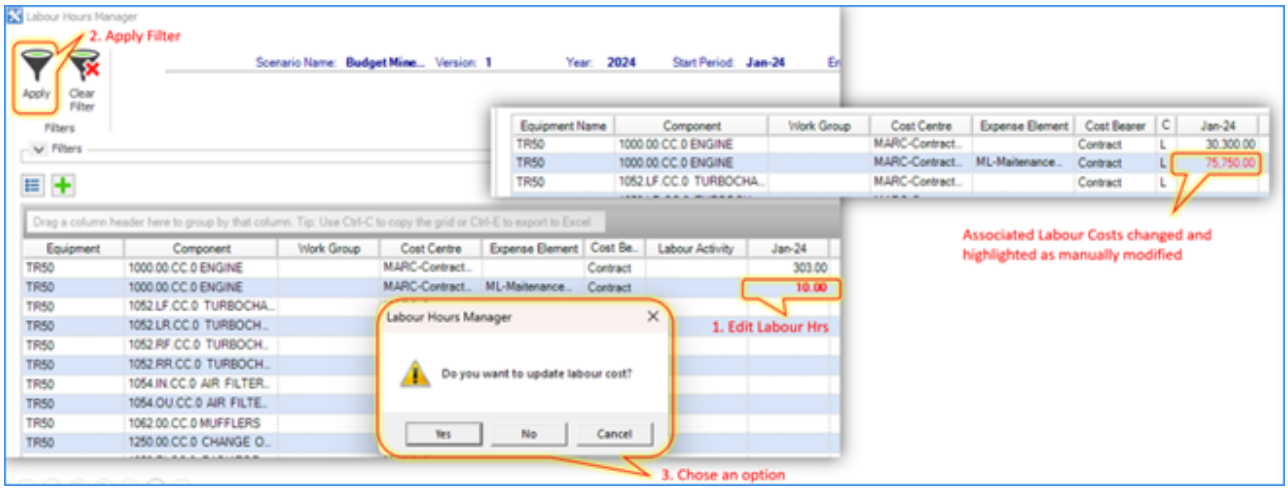

These filters aid in more precise and efficient selection of assets, especially in scenarios with extensive equipment lists, potentially greatly reducing the number of human errors when adding assets, for example instead of selecting 15 different cost centres, select one or two CC Activities that encompasses all the desired cost centres.

AMT also implements additional checks to prevent adding potentially "empty" (no tasks) assets to a budget, given the selected task cost centre filter.

Budget Labour Rates management

AMT 8.26 allows Labour Rates to be fully managed within the Budget module.

The Budget module now fully handles labour rates and preserves a link between labour hours and labour costs. If the user chooses to, changing the labour hours on a given task can automatically change the associated labour costs and vice versa, keeping labour rates consistent.

A **Refresh Labour Rates** button has also been added, enabling users to update labour rates that might have changed on AMT live, changing the associated costs for selected assets.

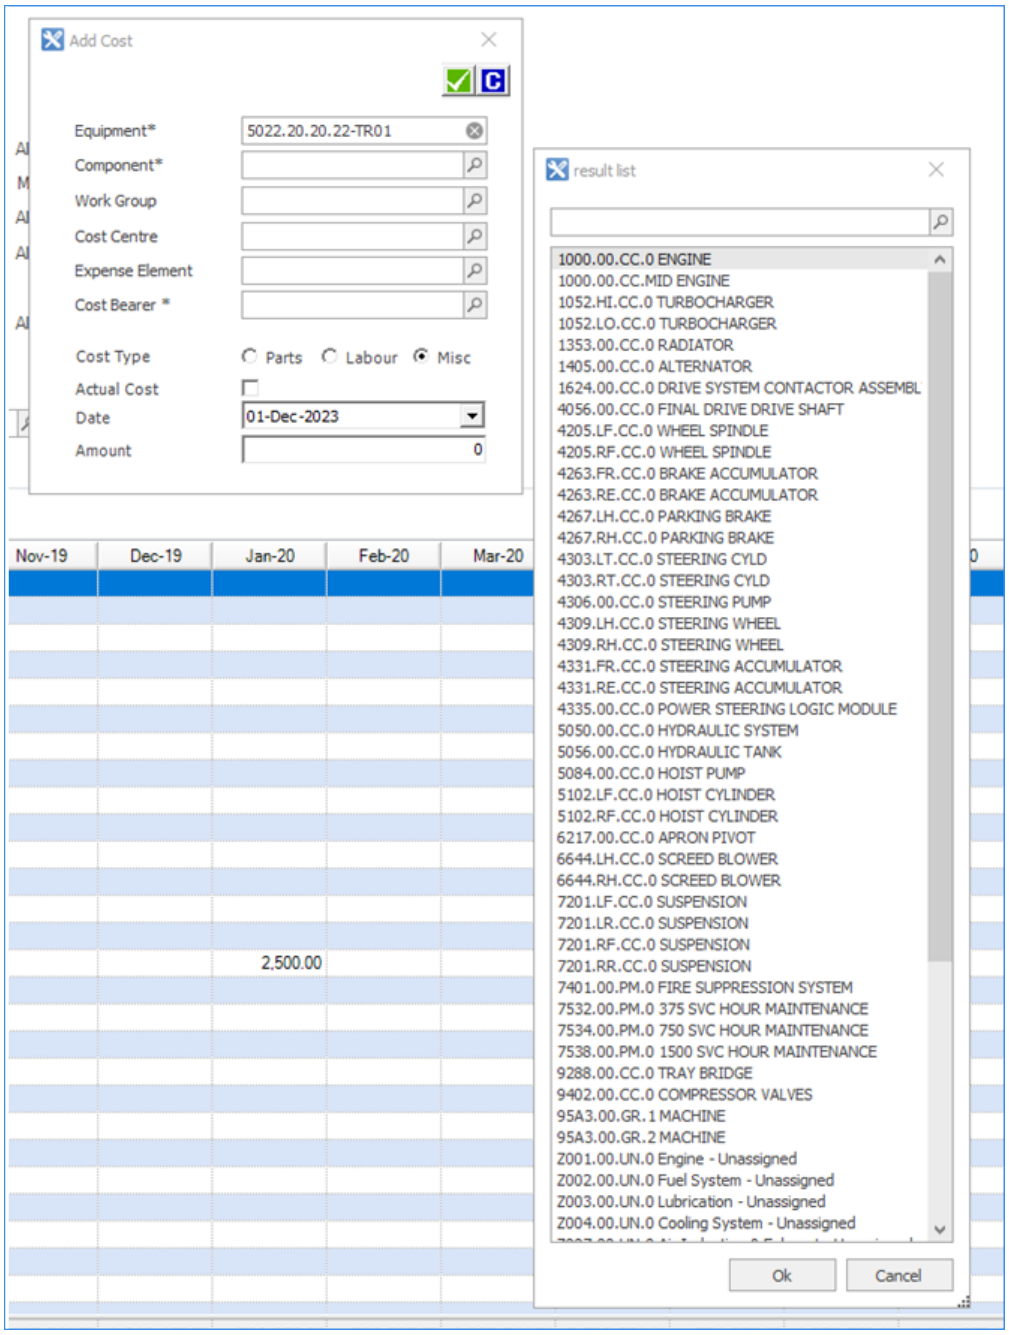

Additional Notes:

- A warning message alerts users about the potential impact on labour costs before proceeding.
- Changes in labour rates won't impact actual occurrences loaded into the budget.

Add any Strategy Tasks to a Budget

In previous versions of AMT, users had the ability to add additional tasks to a budget after it is created by going into **Cost Occurrence Manager**, selecting an asset, then selecting a task. The list of tasks available for selection was limited to tasks that already had an occurrence within the budget. Tasks that were later added to the asset, or ONLY occurrences outside the boundaries of the budget (either before the start or after the end date) wouldn't show on the drop-down box.

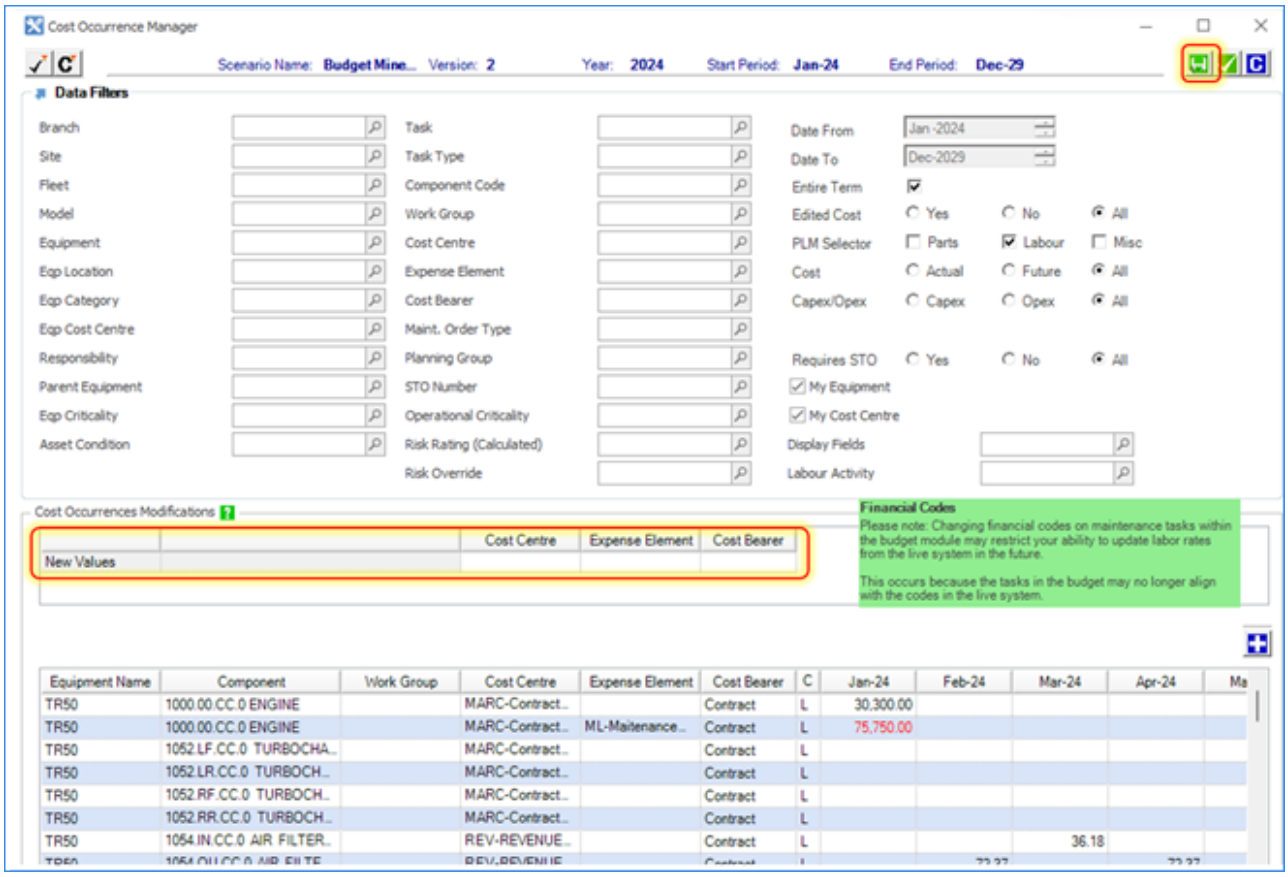

In AMT 8.26, this restriction has been lifted. Any tasks that are linked to the selected equipment in AMT live are now available to be selected on the drop-down box at any time in the **Cost Occurrence Manager** within the **Budget** module, with a new embedded Financial Code Editor for streamlined financial management.

Reassigning financial codes in Budgets

AMT 8.26 enhances the **Cost Occurrence Manager** within the **Budget** module with a new embedded **Financial Code Editor** for streamlined financial management.

A new Financial Code multi-editor grid has been provided, allowing for batch modifications of financial codes of imported tasks.

Users can now easily adjust critical financial codes such as **Cost Centre**, **Cost Bearer**, and **Expense Element**.

This feature simplifies financial reassignments, improving the efficiency of budget adjustments.

Integration Status management

AMT 8.26 includes a new dashboard for real-time monitoring of asynchronous integration messages.

The **Integration Status App** (ISA), a component of the new AMT Web client, provides a centralised view of integration processes, enhancing transparency and control over data flows.

Along with the App, multiple performance improvements were introduced to better cater for larger amounts of data in single messages.

See the AMT Web and AMT Adapter release notes and SDK for more information.

Better Fixed Plant LTP support - Importing predefined shutdown windows

The AMT 8.26 Adapters provide advanced integration capabilities for **Fixed Plant LTP** with a new STO (shutdown) function on the work order adapter. The adapter enables efficient import and update of revision details from SAP or other ERP's. This feature allows for more accurate cost reconciliation and categorisation for Fixed Plants enhancing budgeting accuracy.

See the AMT Adapter release notes and SDK for more information.

Enhanced budget vs actuals analysis

Enhanced budgeting analysis through the import of actual costs along with shutdown revision codes.

Especially relevant for **Fixed Plant**, this update provides deeper insights into budget variances at the revision level, aiding in more accurate and detailed financial analysis.

More detailed control for reference codes

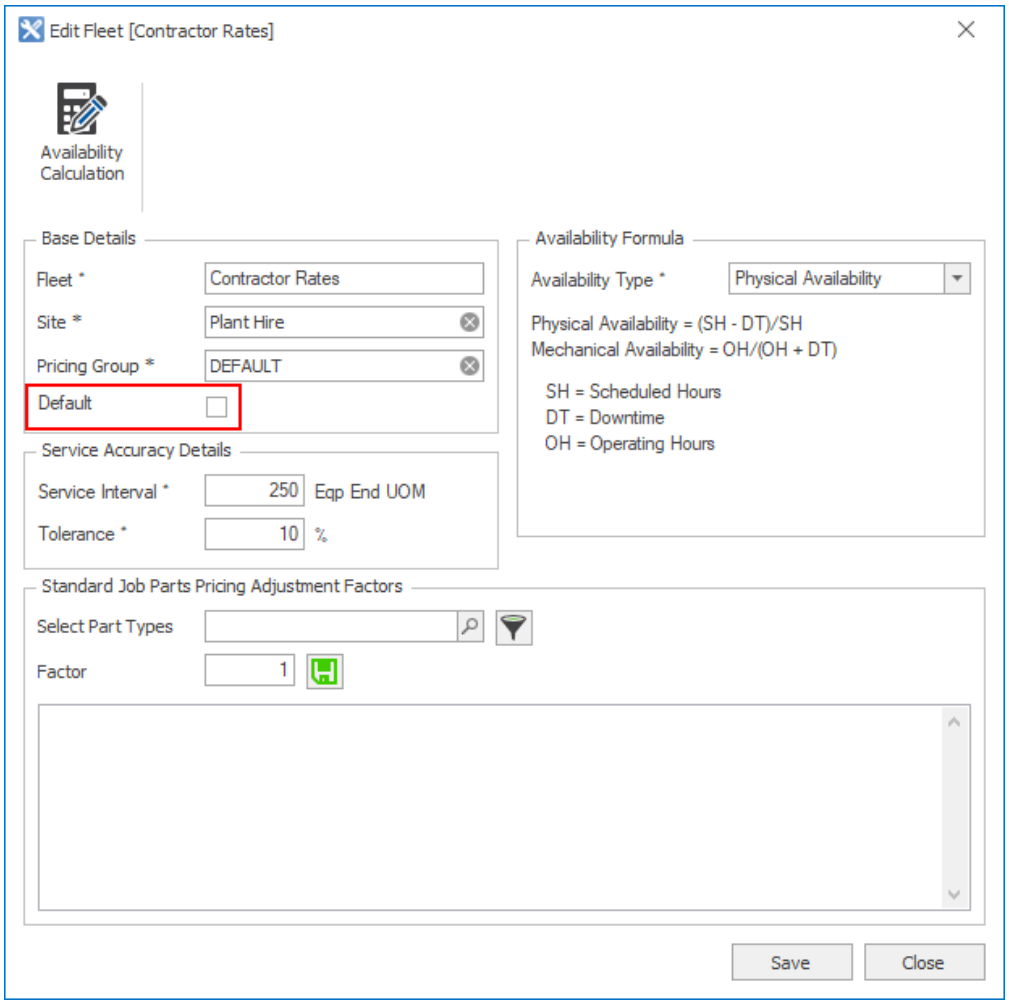

The AMT 8.26 Adapters include new functionality to protect manually updated data in AMT from being overwritten during integration.

New settings in **AMT_TYPED_VARIABLE** allows users to set reference code processing to insert only, preventing the overwriting of existing data in AMT during updates.

See the AMT Adapter release notes and SDK for more information.

Default fleet system editor

AMT has always supported the notion of a default fleet, but this was never exposed via the Edit Fleet form. In AMT 8.26, the **Edit Fleet** form exposes the default fleet attribute.

New Checklist Data Model

A new AMT **Checklist Data Model** has been developed, enabling exciting new Checklist reporting possibilities. Examples include, reporting on the results of the checklists completed. This includes the person and time of completion, as well as responses to all checklist questions, including any notes and provided attachments. All checklist data model database views belong in a new database schema named **ChecklistDataModel**.

Models exposing checklist event-based information:

- **ChecklistResultResponse**: Each row represents the response to a single question (Checklist Template Question) within a completed Checklist Result. Information is available on which question was answered, the response value, as well as any associated notes and attachments.
- **ChecklistResult**: Each row represents the completion of a single checklist on a mobile device and includes metadata such as Checklist Template used, Checklist Type, Asset, Work Order Number, Created By User and Created Date. Typically, this view will be used when checklist question responses are not required, or to lookup metadata that is not present in the ChecklistResultResponse view.

Models exposing lookup/reference information:

- **ChecklistType**: All the possible checklist types, such as Notification and Work Order Close.
- **ChecklistTemplateStatus**: All the possible checklist template statuses, such as Approved and Archived.
- **ChecklistTemplateQuestion**: All questions defined within all checklist templates. Some key attributes include the question type question title, data target, section and question order within the parent checklist template. Some attributes only apply to certain question types. Examples include Available Options, Unit of Measure and Measurement Code information.
- **ChecklistTemplateSection**: Questions are situated within checklist template sections. Section information such as the title and order within the checklist template is exposed.
- **ChecklistTemplate**: All checklist template questions and sections belong and refer to a single checklist template. All the checklist templates defined with their version, type, status and title are available. Information about all previous checklist template versions is also available.

Security improvements

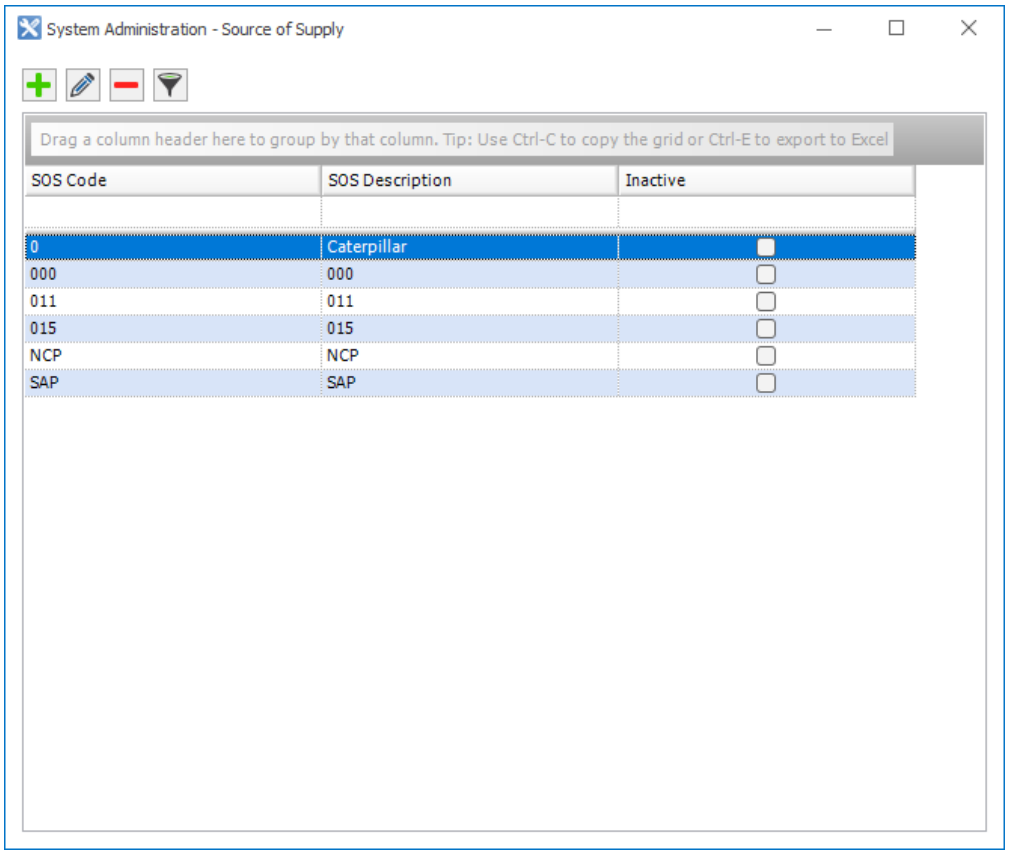

AMT 8.26 contains numerous security improvements.

Localised online help

AMT 8.26 supports the display of online help in the user's language. 8.26 includes support for English and Spanish.

Source of Supply system editor

AMT 8.26 includes a system editor for Source of Supply.

Extended Health Check

AMT 8.26 extends the number of data integrity checks that can be executed by support specialists. This makes the identification and rectification of data issues easier and faster. Specific extensions to the Health Check Script are:

- Usage Profile End Dates
- Downtime Validation
- Life Achieved Validation
- Start Usage Validation

Microsoft Entra (AAD) - AMT User Account Synchronisation

AMT internally manages a list of users along with their associated role and permissions independently of other authentication systems such as Active Directory and Microsoft Azure Entra. AMT can be made to integrate with these external systems by linking users with the external system's user identifies.

Historically, for Microsoft Entra, the responsibility of linking and aligning user details fell upon AMT administrators. This was done via the **Authentication Integration** section of the **User Account** feature in the AMT Client application. AMT administrators would need to manually add, or update AMT users, and associate each of them with their Microsoft Entra User Object id. They were also responsible for setting the terminated status of AMT users, so it matched the Account Enabled property of the linked Microsoft Entra User.

The **AMT.Microsoft.Entra.Service** Windows Service, an optional component of AMT 8.26, was developed to take the burden of linking and synchronising AMT users with Azure Entra Users off AMT administrators. It can automatically synchronise Azure Entra user accounts with AMT user accounts. Futhermore, as a frequent and automated process, it significantly reduces the amount of time where Azure Entrra user accounts and AMT user accounts are out of alignment.

The AMT.Microsoft.Entra.Service Windows Service periodically synchronises some attributes of AMT users with Azure Entra user accounts, in the background. The service will be configured to synchronise with all members (users) of either an:

- Azure Entra Group, or
- Azure Enterprise Application

This enables the subset of Azure Entra user accounts requiring access to AMT to be managed in Azure. Only these Azure Entra members will be synchronised with AMT users.

Azure Entra Users are linked to AMT users through their Azure User Object Identifier (AAD OID). This is an optional attribute available to AMT users. The service can add new AMT users as well as activate or terminate existing AMT users as required.

More information is available from your AMT Account Manager.

AMT4SAP: Catalogue Profiles

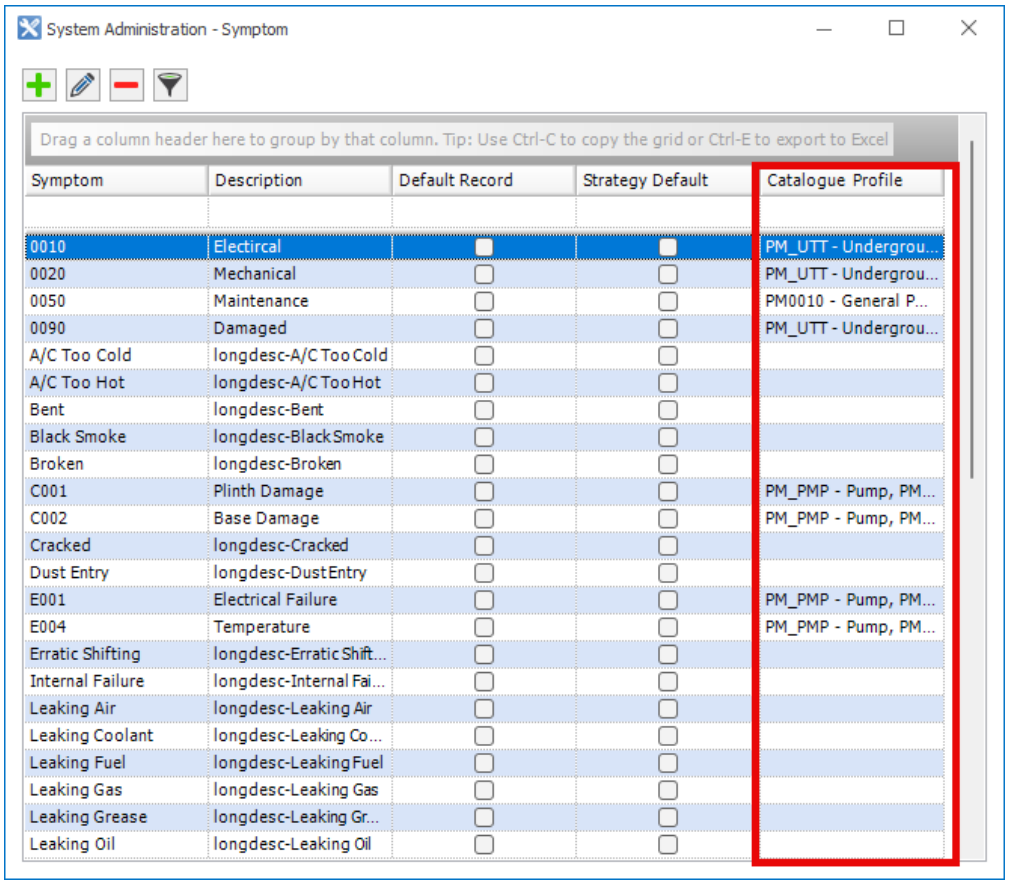

AMT 8.26 adds support for **Catalogue Profiles**. Catalogue profiles, introduced as part of the AMT4SAP solution, allow for the logical grouping of **Symptom**, **Cause** and **Object Part** codes (Object Parts are described below).

A Catalogue Profile is an optional attribute of Assets and Notifications. When an asset or notification is associated with a Catalogue Profile, the Symptom, Cause and Object Parts available for selection are limited to those defined in the related Catalogue Profile.

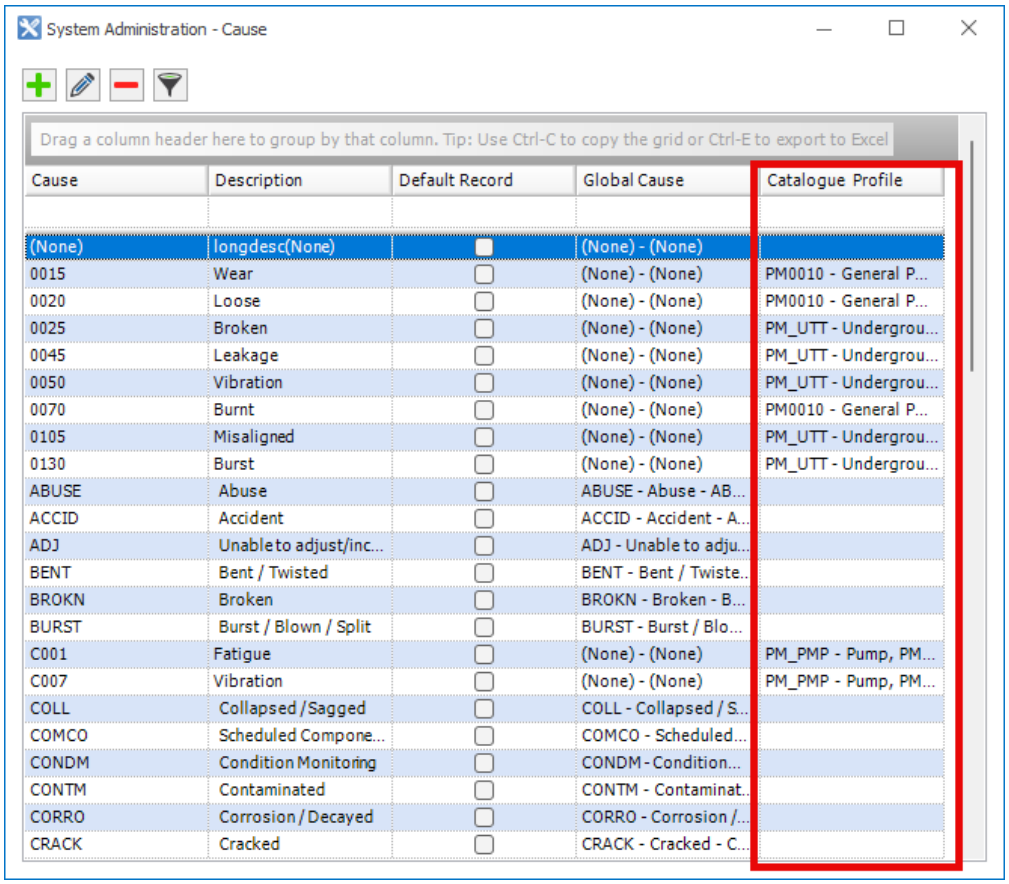

The Catalogue Profiles Symptoms, Causes and Object Parts can be seen in the relevant AMT System Table editors.

Catalogue Profiles are maintained by the **ProcessCatalogueProfile()** AMT Adapter method.

Object Part

AMT4SAP: Object Part

AMT 8.26 adds a new entity, Object Part. Object Part is synonymous with a component code, or may be a different level of detail (greater or lesser) depending on any FEMA or FEMCA reporting being undertaken. Object Part has been introduces as part of the AMT4SAP solution.

An object part consists of:

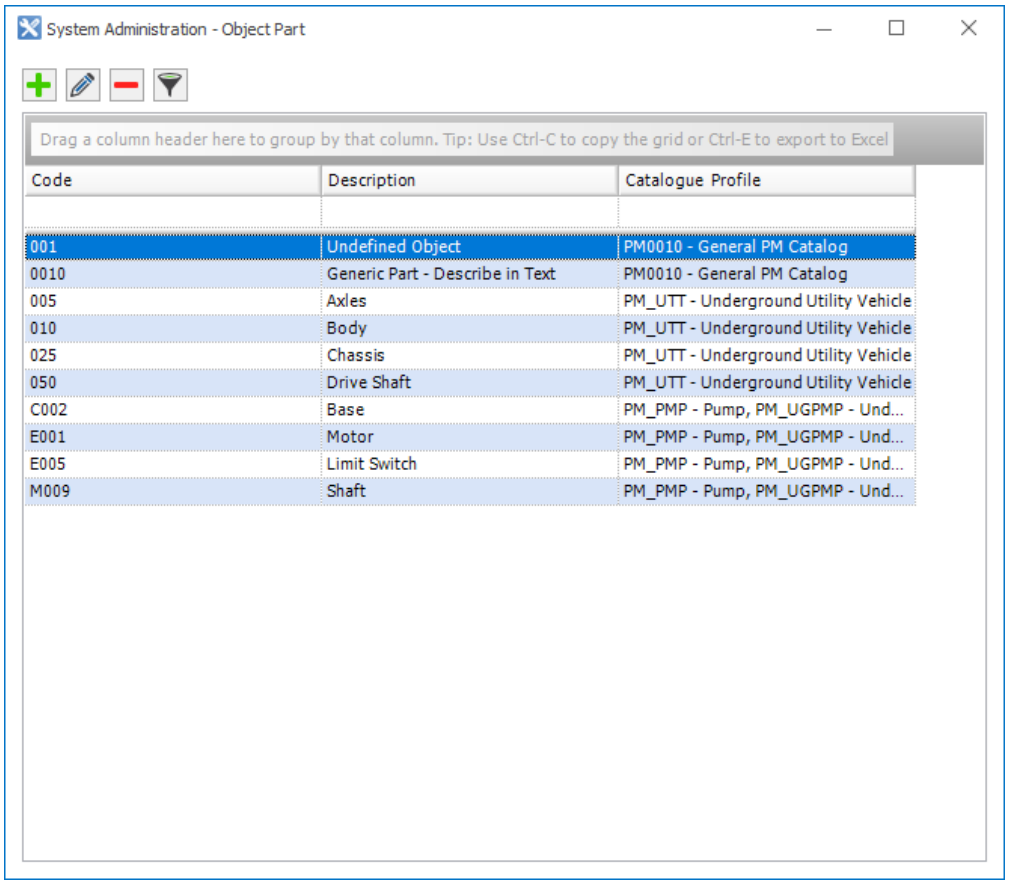

- A unique code
- Description

An object part may also be referenced by the new Catalogue Profile feature.

The following AMT entities have been extended to support an optional object part.

- Notifications
- Work Orders

A new System Table editor is provided to allow manual management of object parts.

AMT4SAP: Equipment Planning Groups and Work Groups

A default Planning Group and Work Group held at the Equipment has been a commonly asked requirement for AMT4SAP customers. AMT 8.26 addresses this requirement by:

- Extending the Asset entity with non-mandatory Planning Group and Work Group attributes.
- Extending the Notification entity with non-mandatory Planning Group and Work Group attributes. Notification Planning Group and Work Group will default from the Equipment record details if those fields have been populated. Notification Planning Group and Work Group can be overwritten to a different Planning Group and/or Work Group.
- Extending AMT Mobile to support Notification Planning Group and Work Group when creating Notification Checklists.
- Extending the AMT Integration Adapters to support the specification of Planning Group and Work Group on Assets via the ProcessAsset() method.

AMT4SAP: Reservation Number

AMT4SAP clients have requested support for the **SAP Reservation Number** allocated to each Material Requirement on Maintenance Order Operations.

When a SAP Material Requirement (part in AMT terms) is added to a Maintenance Order Operation it will be given a SAP-generated Reservation number per line item. The Reservation Number is used when the technicians communicate with warehouse or store personnel.

In AMT 8.26, the SAP Reservation number is exposed as a new attribute of a work order operation part record. It is:

- stored against a work order operation part.
- visible in the AMT work order **Parts** tab.
- exposed on the Mobile application.
- specified via integration using the **CreateWorkOrder ()** and **UpdateWorkOrder()** adapter methods.

See the AMT Adapter Release Notes and SDK for more information.

Web Enhancements

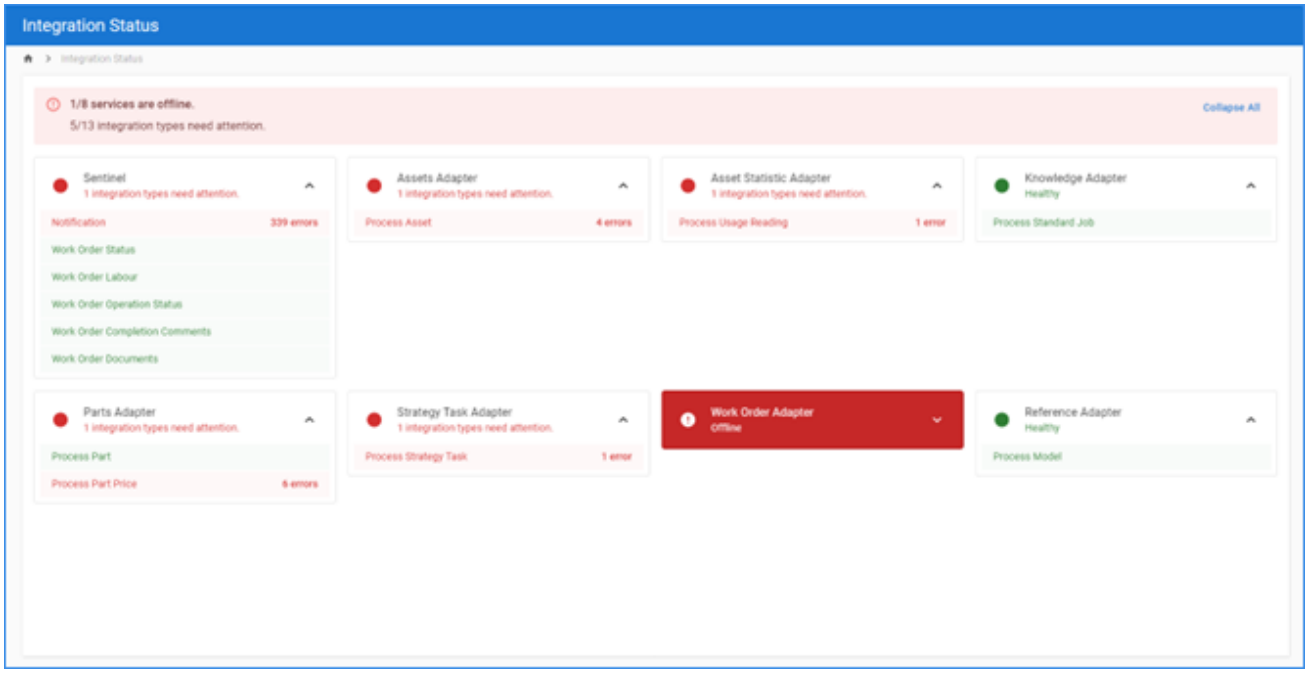

The following are the change requests and enhancements addressed in this release.

Integration Status Application

The Integration Status application has been extended to now support inbound integrations with external systems such as SAP. The user now has the ability to view the status of integration transactions for the SAP adapters alongside the Sentinel integration transactions.

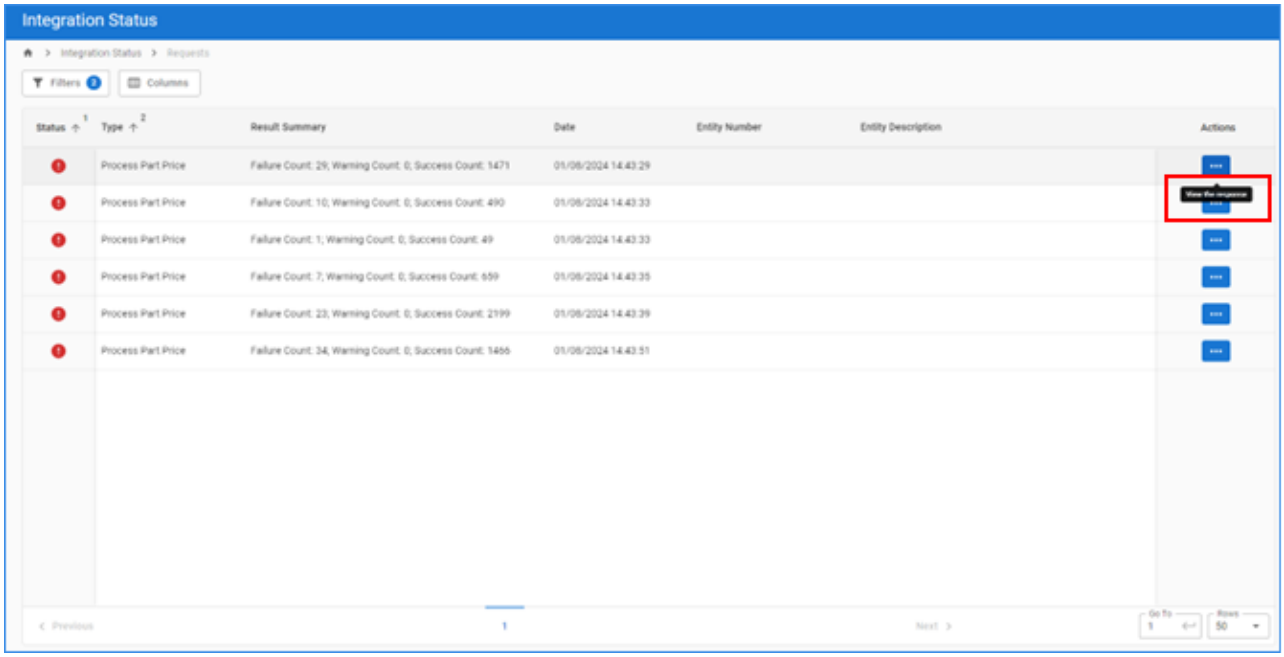

Dashboard

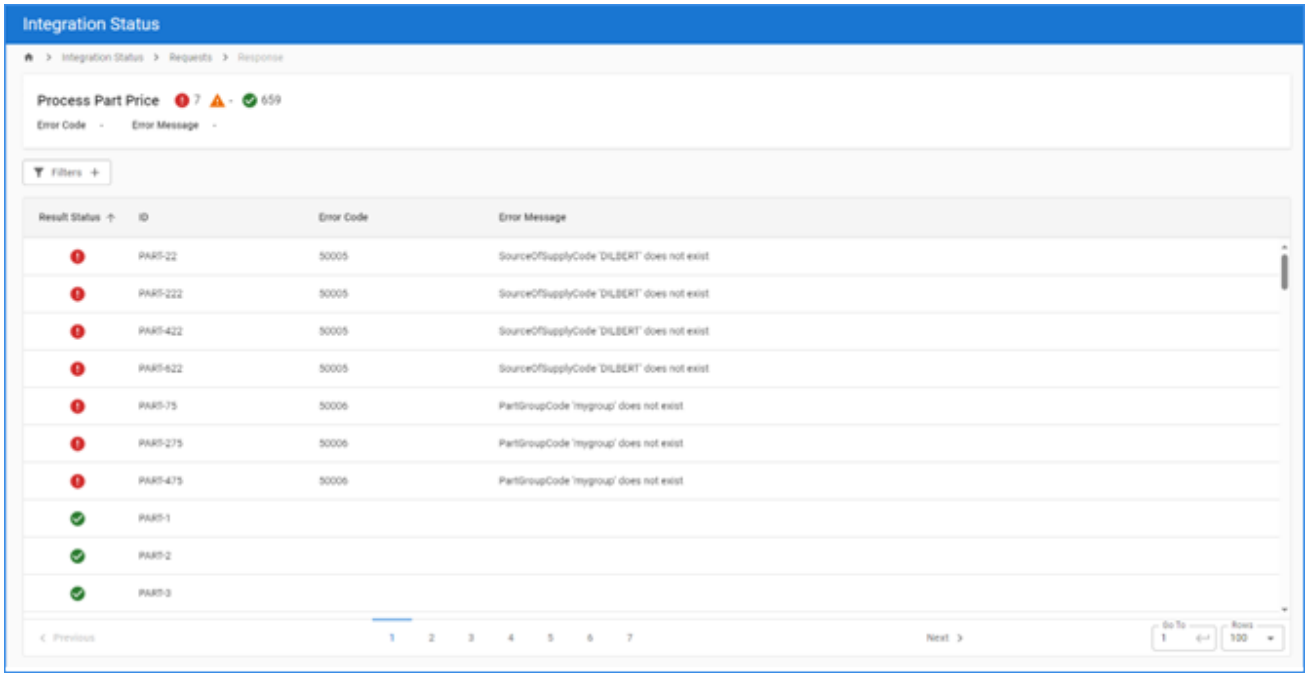

The new Integration Status Dashboard allows the user to visualise all the configured integrations for AMT and what the status of those integrations are in a single view.

Inbound integration transactions have the added capability of allowing the user to drill-down into the transaction payload to view the details of each transaction.

Each request gives the user the ability to view the response associated with that request by clicking the **View Response** button.

The user can then see a summary of the response at the top of the screen, with a paginated view of all the entities processed in the response and their associated status below.

Checklist Management Application

- General code improvements to make the application more maintainable and robust.
- Implemented user permissions to restrict functionality based on user role.
- Improved Question Management to allow multiple deletions.
- Increased the number of automated test cases to improve quality.

Checklist Results Application

- Improved formatting of results meta-data including Work Order/Operation identifier.
- Added the details of the employee completing the checklist to the results screen.
- Removed the Asset Id from the checklist result header.
- General navigation and formatting improvements of the checklist result.

Common

- Improved language and locale settings.
- Removal of outdated code to improve maintainability and reduce the size of deployable components, hence improving load times on the browser.

Fixes

Functional Area	Fix	Work Item	Case ID
Client			
Billing	Fixed an issue where the **Biling Escalation** form was not creating correct billing steps for billing schedules where the type is Usage rate by Monthly date range or Monthly rate by Monthly date range.	34149	145887

Functional Area	Fix	Work Item	Case ID
Budgeting	Fixed an issue where the **Budget Compliance - Modelling** and **Budget Compliance** reports could raise an error.	66849	180676
	Fixed an issue where the process of applying cost escalations for equipment in a budget could move the occurrence/month the costs fall in. In some scenarios, this could push costs outside the Equipment term/End date, excluding costs from the Equipment cost analysis reports.	66923	180630
	Fixed an issue where STOs were being recorded at the budget task level instead of the occurrence level.	64322	
	Fixed an issue where equipment with no cost centres would be added to a budget, even though the equipment filter used to select equipment included specific cost centres.	65607	
	Fixed an issue where a user could assign a budget status that was not in the list of available budget statuses.	66781	180663
	Fixed an issue where the **Add Equipment** form cost centre filters were not cascading.	65251	
	Fixed an issue where the **Cost Occurrence Manager** was showing values after the **End Date** of an **Asset**.	63485	176467
	Fixed an issue in the Budget > Cost Occurrence Manager where minimising the filters would result in a large blank space appearing on the form.	66656	180620
	Fixed an issue where the Equipment Cost Escalation form could cause an error with specific values.	65813	180079
	Fixed an issue where the Forecast Cost Adjuster could raise an error.	65664	179952
Budgeting continued	Fixed an issue where invalid occurrences are created if **Not After** is set to be before the equipment start date.	64951	178850
Builder G3	Improved SOS validation in Builder G3 **Import Standard Jobs**.	62513	172806
	Resolved a performance issue importing **Parts** and **Prices**.	62108	174640

Functional Area	Fix	Work Item	Case ID
CBM	In the **Measurement Editor**, spelling has been corrected from Measurement to Measurement.	66587	180547
DLCC	Improved DLCC performance by reducing the number of projections requiring re-calculation.	64453	177113
	Fixed an issue where the **Recalculation Manager** wasn't showing that projection requires calculations if component life needs to be recalculated.	64470	
	Improved the performance of flag deletion, which in turn improves overall DLCC performance.	64836	177113
	DLCC now marks terminated equipment to be recalculated if the equipment contains invalid usages.	63913	177138
	DLCC performance improvements in the areas of work order settlement linkage and sales history creation.	65803	
	Fixed an issue where specific data could cause the DLCC process to fail.	63772	177113
	Improved the performance of the **DLCC Component Life** algorithm.	63722	177113
EM	Fixed an issue that could cause EM Registrations to fail.	62815 64006	175550 177516
Equipment	Fixed an issue where equipment with a strategy task linked to a work order could not be deleted, either individually or via the Multi-Equipment editor.	62211	
Events	When an event is abandoned, work orders which were abandoned using the option **Abandon Workorder and maintain Workorder link** now maintain the **Completed** status.	63484	176602
Excel	Fixed an issue where hard return/line feed codes at the end of copied data would interfere with the paste command.	61901 61632	174631 174037
Fleets	Fixed an issue where the Fleet **Default Organisation** warning would not appear when adding a new fleet.	63287	

Functional Area	Fix	Work Item	Case ID
Integration	Classic interface file import and export are now supporting both **ASCII** and **Unicode** encoding. By default, Unicode encoding is considered, however ASCII encoding will be used if **ImportExportFileUsingASCIIEncoding=1**.	64543	178252
Notifications	Fixed an issue editing **Notifications** where a user belonging to AMT Groups with no Notification permissions could create and edit Notifications.	61870	174205
Parts	The performance of the **Part Forecast** algorithm has been improved. Prior to this enhancement, the Part Forecast system task could fail due to a timeout.	63095	178534
	The performance of the **Part Forecast** algorithm has been improved. Prior to this enhancement, the Part Forecast system task could fail due to a timeout.	62355	174937
	The **SP PART_PRICE_P.sql** which is called by the **SP PARTS_MANAGER_GET_P** (to show in **Parts Manager** view) has a logic to insert invalid part prices, which is an existing expected behavior.	61590	173976
Planning	Fixed an issue where planned downtime would have different values in different views if the **Planned Up and Down Date/Time**, **Actual Down Date/Time** and **Expected Update** were after the Equipment end date.	65653	179903
	Fixed an issue where overdue next occurrences linked to maintenance points were not being deleted when required.	61579	173813
Planning continued	Fixed an issue where deleting tasks in both the **Strategy Task Manager** and **Multi-equipment Editor** for multiple equipment could result in the tasks not being deleted.	64225	176671
	Fixed an issue where errors could appear when filtering on **Planning Groups** in **ShiftLog**.	62960	175763
	The Scheduled Frequency typo in the Long-term Planning Advanced form has been corrected.	64415	178146
Planning Groups	Fixed an issue where the classic **Strategy Task** import interface did not properly set the **Planning Group** code.	65504	179569

Functional Area	Fix	Work Item	Case ID
Projections	Fixed an issue where auto-create projections was not working during equipment import using the classic **Equipment Import** interface.	62068	174648
Quick Watch	Fixed an issue that could cause the **Quick Watch Overdue Component Changeout** process to fail.	65514	179639
Reports	Fixed an issue where the **Actual Usage** report displays**#####** for very large values.	66841	180672
	Fixed an issue in **the Event Completion Performance** report that could cause an error when specifying certain filter combinations.	61726	174208

Functional Area	Fix	Work Item	Case ID
Reports continued	Fixed several issues with the deployment of **SSRS reports** to non-standard locations. • Support for a customised SSRS report path. If the customer changes the SSRS report path other than the root path (for example a subfolder) in the AMT configuration, the SSRS report path will be updated automatically, and no errors will occur when opening the report. • Fixed an issue where several AMT standard reports were shown as user-defined reports. • Changed the following system tasks to be manually triggered. ◦ SSRS Manager ◦ SSRSManager-RefreshAMTReport	63406	174872
	Fixed an issue where the **Budget Comparison - High Level** report displays **#####** for very large values.	66945	180744
	Fixed an issue where the **Budget Equipment Summary** Report displays **#####** for very large values.	66937	180750
	Fixed an issue where the **Changeout Forecast Worksheet** report would consider all projections instead of just the current projection.	66896	180674
	Fixed an issue where the **Contract Revenue Recognition - @Cost** standard report could raise errors when certain filters were supplied.	64799	178578
	Fixed a truncation issue in the **Budget Equipment Cost Analysis** report.	62128	174740
	Fixed an issue where the **Standard Job Manager**/**Standard Job** report could not be executed under specific conditions.	62129	174227
	Improved the performance of the **Audit Log** view and **Audit Log** report.	62168	

Functional Area	Fix	Work Item	Case ID
Reports continued	Fixed a site filter issue in the following reports: • What-if - Period Analysis • WorkScope Coverage • Fleet Cost and Recovery Schedule • Redo Analysis • Employee Working Status Summary • Warranty Claim • Warranty Analysis • Plant Hire Invoice Summary • Resource Availability and Fill - Work Group • Workorder Settlement Transactions • Cost per Interval – Customer • Asset Valuation • Forecast Cost Analysis • Planned Workorder Details • Asset Cost Worksheet • Cost Cap Financial Summary • Usage Analysis Chart • Actual vs Archive Period Analysis • Backlog Ageing • Billing Interrogation • Archive Cost Analysis • Archive Cost Worksheet • Budget vs Current Projection Details • Changeout Analysis • Equipment Cost and Recovery Analysis • Projection Comparison • Cost per UOM - Comparison • Cost Variance Analysis • Equipment Performance	61963	

Functional Area	Fix	Work Item	Case ID
Reports continued	• Financial Summary • High Opportunity • Labour Hrs Variance Analysis • Life Cycle Cost Summary • PCV Analysis • Planned Downtime Events % • Resource Availability and Fill - Employee • Employee Allocation • Snapshot - The Worm • Snapshot Summary • Standard Job Coverage • Standard Job Interrogation • Summary Analysis • Workorder Details • Technical Performance Analysis • Technical Performance Analysis Chart • Technical Performance Details		
	Added pagination to the **Strategy Task - Standard Job Detail**s report to better manage large volumes of data.	62537	174414
	Fixed an issue in the **Strategy Task Margin Analysis** Report that could result in an error when certain parameters were specified.	62795	174410
	Fixed an issue where the **Forecast Cost Analysis** report did not allow the selection of projections in the **Bar** and **Pie** views.	66733	180656
	Fixed an issue in the **Forecast Cost Analysis** report where specific filters could result in an error while previewing the report.	64858	178793

Functional Area	Fix	Work Item	Case ID
Reports continued	Fixed an issue in the **Forecast Rotables Stock** report where the selected part type was not reflected in the report contents.	63929	177249
	Fixed an issue in the **High Opportunity** and **High Risk** reports that could cause an error when specific filter combinations where used.	64577	178312
	Fixed an issue in the **Life Cycle** report that could result in an error after using the report drill-down then clicking the **Back to Parent** button.	57357	167932
	Fixed an issue in the **Forecast** report where no data would be returned due to the inclusion of a Dealer ID.	64139	177213
	Fixed an issue when filtering by **Part Number** in the **Part Usage Details**, **Parts Usage Analysis-Value**, and **Parts Usage Analysis-Qty** reports.	61592	173980
	Removed the hard-coded **$** symbol from the **Equipment Summary** report.	63361	176462
	Fixed errors in the **Cost per UOM - Comparision** report by doing the following: • Fetching Projections from a report-specific stored procedure for the **Projection** search filter in the report parameters. • Considering the first 50 characters (instead of 20 characters) of the **Analyse By** field to resolve a Crystal Report error.	61035	173226
	Fixed an issue in the **Standard Job** report that could cause the report preview to raise an error.	61670	174161
	Fixed an issue in the **Planned Work Order Details** report where Actual Usage Reading: Current Usage, Actual Usage Reading: Current Usage Date were missing.	61932	174364
	Fixed an issue in the **Variance Analysis Worksheet** report that could result in incorrect filtering of results.	63973	177420

Functional Area	Fix	Work Item	Case ID
Risk	Simplified **Risk Grouping** feature description text to: Risk Grouping will normalise AMT's Calculated Risk (based on Equipment Criticality * Asset Condition * Operational Criticality) into user defined 'bands'.	61589	173963
SharePoint	Fixed an issue where hosted Sharepoint document libraries could not be accessed when using Azure Active Directory authentication.	62816	173700
Standard Jobs	Fixed an issue where an error could be raised while importing **Standard Jobs** via the web service.	64923	178826
STO	Removed the **TransactionScopeRequired** attribute from **AddAndUpdateSTO()** method to resolve a Mismatch Transaction error.	65235	179344
Strategy Tasks	Fixed an issue where it was not possible to delete strategy tasks linked to a work order.	62091	
	Fixed an issue where unplanned strategy tasks without descriptions were not available to be selected when adding strategy tasks to an event.	64966	177172
	Fixed an issue where **Strategy Task Analyser** could raise an exception when analysing strategy tasks with different CapEx flag values.	62962	175776
System Administration	Updated the AMT system task configuration so as not to stop the **SQL Agent CDC capture** job.	63532	176737
	Fixed an issue that could result in the **IC Extract System Task** (which also affects the IC Import and Process OLAP SSAS system tasks) to fail.	63588	174875
Usages	Fixed an issue with loading actual usages where specific timezone and daylight savings combinations could result in the error message "The specified DateTime value represents an invalid time."	61160	173424

Functional Area	Fix	Work Item	Case ID
Windows Client - General	Changes have been made to persist the **User Settings** in **Daily Planning** and **Parts Manager** views, when a user saves (cancels or closes) these views and logs off from AMT Client.	62374 62250	175024 173434
Work Orders	Fixed an issue where under specific circumstances **Abandoned Work Order** shows **<Due>** and the settlement number.	60498	172723
	Fixed an issue where adding **Symptoms** and **Causes** to the Work Order via the **Feedback** tab could result in an error.	64608	178254
	The message displayed when delinking a work order from an event has been changed to **Do you want to delink work order <description>?**	61751	
	Fixed an issue where the **WOCounter/Date** was not recorded when a failed **PO Creation** event was marked as completed.	62511	
	Fixed an issue that could cause an error during **ERP WO** creation in **WO** mode.	62460	
	Fixed an issue where the **Work Order Number** could be removed when two or more users or processes updated the same work order.	65840	179481
	Changes have been made to persist the **User Settings** in **Daily Planning** or **Parts Manager** views, when a user saves (cancels or closes) these views and logs off from AMT Client.	62096	174224
	Fixed an issue where the **Workorder Settlement Interrogation** report did not return data when linked to a Dealer.	64138	176971

Functional Area	Fix	Work Item
Web		

Functional Area	Fix	Work Item
Checklist Management	Fixed an issue with the **Section title** getting cut off on hover.	60326
	Pagination components no longer become out of alignment.	60327
	When discarding changes to a custom question, the next question is no longer selected.	60704
	Fixed an issue with archived checklists still showing the option to archive.	62539
	Fixed an issue with an error being shown when committing an already committed question. A warning is now shown, and the question updates to the latest.	62442
	Fixed an issue where the **Delete** button was showing incorrectly for In Design questions.	60705
	Fixed issues with the tree view selection of checklist templates.	62501, 63456
	Added proper error handling when attempting to navigate to a non-existent checklist or question.	63101
	Fixed issues with navigation.	63102, 63921
	Fixed an issue where the default of the **Yes/No** question was causing processing errors on receipt of results.	63841
	Fixed an issue with the **Describe Part** question, where the **Type** was being incorrectly being displayed as a dropdown question instead of a text question.	63850
	In the **Signature** question, the **Completed By** field is now mandatory to be inline with the previous **Work Order Close** functionality.	63920
	The **Notification** template no longer displays incorrect data targets.	63944
	Fixed an issue with the **Work Order Close** template creation.	63944
	Fixed a checklist template archive issue.	65322

Functional Area	Fix	Work Item
Checklist Results	Fixed an issue where **Results** were not showing the **Work Order Operation** number.	56642
	Section badge numbers are now correct.	65175
	Fixed an issue with an error on future and current dates.	65191
	Implemented pagination of checklist results to overcome a missing results issue.	65247
	The **Operation Number** no longer displays twice in the **Work Order** field.	65554
	Fixed a date misalignment issue in the timeline component.	65604
	There is no longer a blank screen after clicking a breadcrumb.	66513
Notifications	Fixed an issue where refreshing from any page in the grid always results in the first page being displayed.	60619
	Fixed an issue where a **Notification** without a **Work Order Id** attempts to open the AMT Client.	62510
	Fixed an issue with opening the AMT desktop client from a Work Order link.	63278
	Fixed an issue with incorrect Notification filter labels being displayed.	63832, 64682
	Fixed an issue with the Asset list not being shown in the **Create Notification** dialog.	64967
	Fixed an issue where the **Planning Group** and **Work Group** were showing as empty values in the grid.	65513, 66530
Integration Status	Fixed an issue with an inappropriate filter snack bar message was displaying.	63390
	Fixed an issue with Status tiles flashing when paging transactions.	64915
	Fixed an issue with sorting and filtering on the Results grid.	66549

Functional Area	Fix	Work Item
Common	Fixed an issue where the Rail menu was not changing languages until the page was refreshed.	62547
	Fixed various translation issues across the web app.	62550
	User settings now correctly save pinned columns in data grids.	62467
	Fixed build issues.	63533

AMT 8.25

The following is a list of all changes and updates addressed in AMT 8.25.

From this release onwards, release notes will include the Client and Web versions. AMT Mobile has their own release notes.

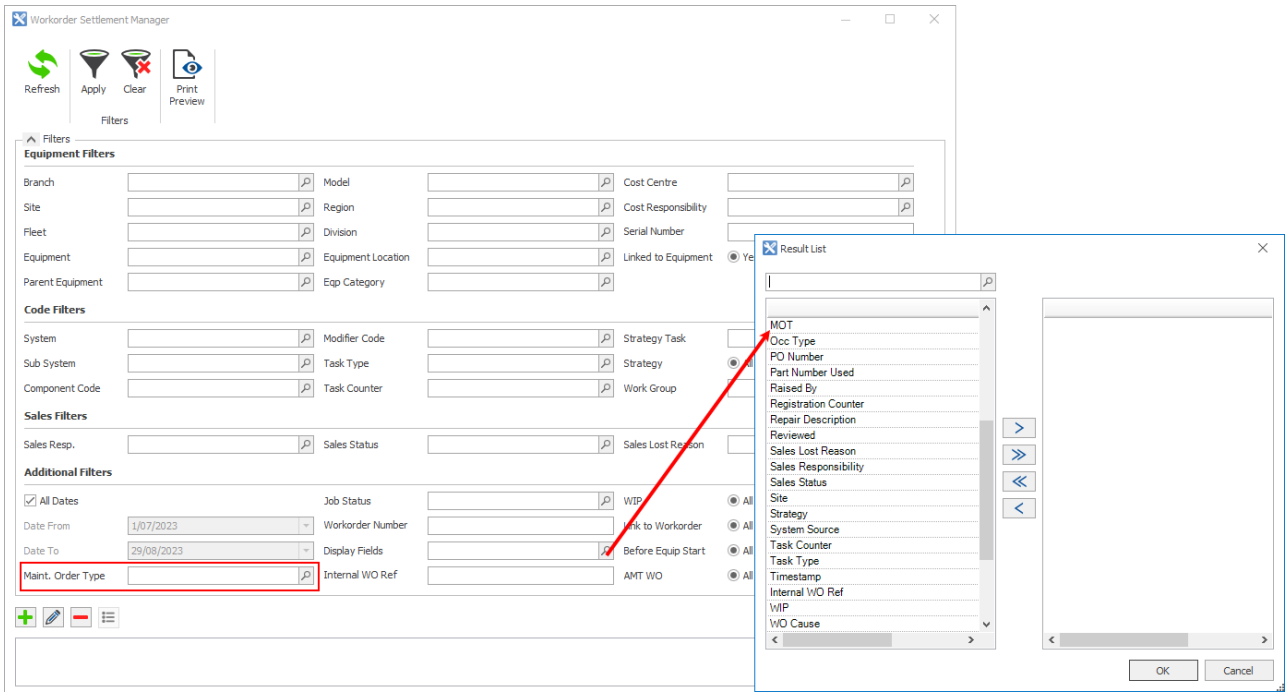

New Features

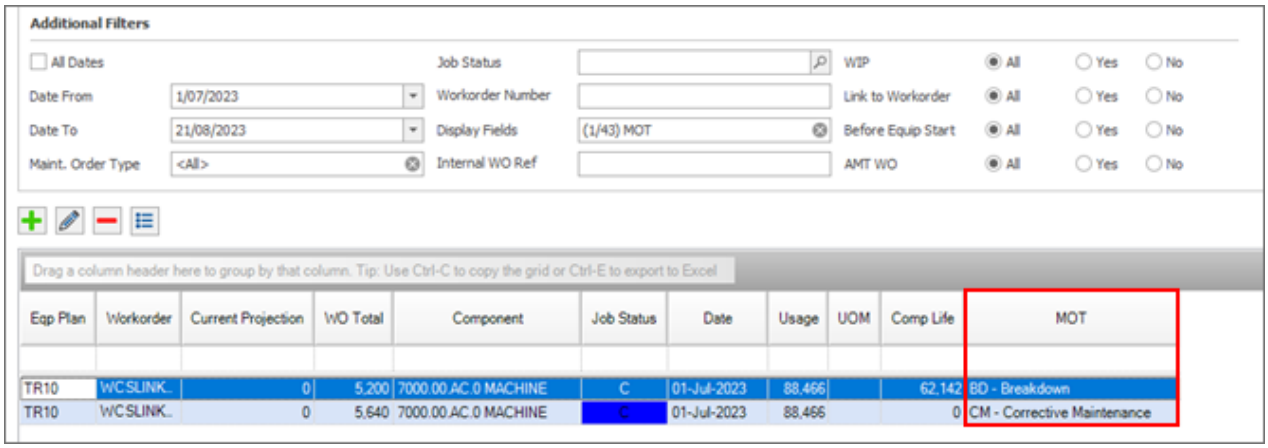

Analyse costs by Maintenance Order Type (MOT)

Several areas in AMT have been enhanced to allow cost analysis by maintenance order type.

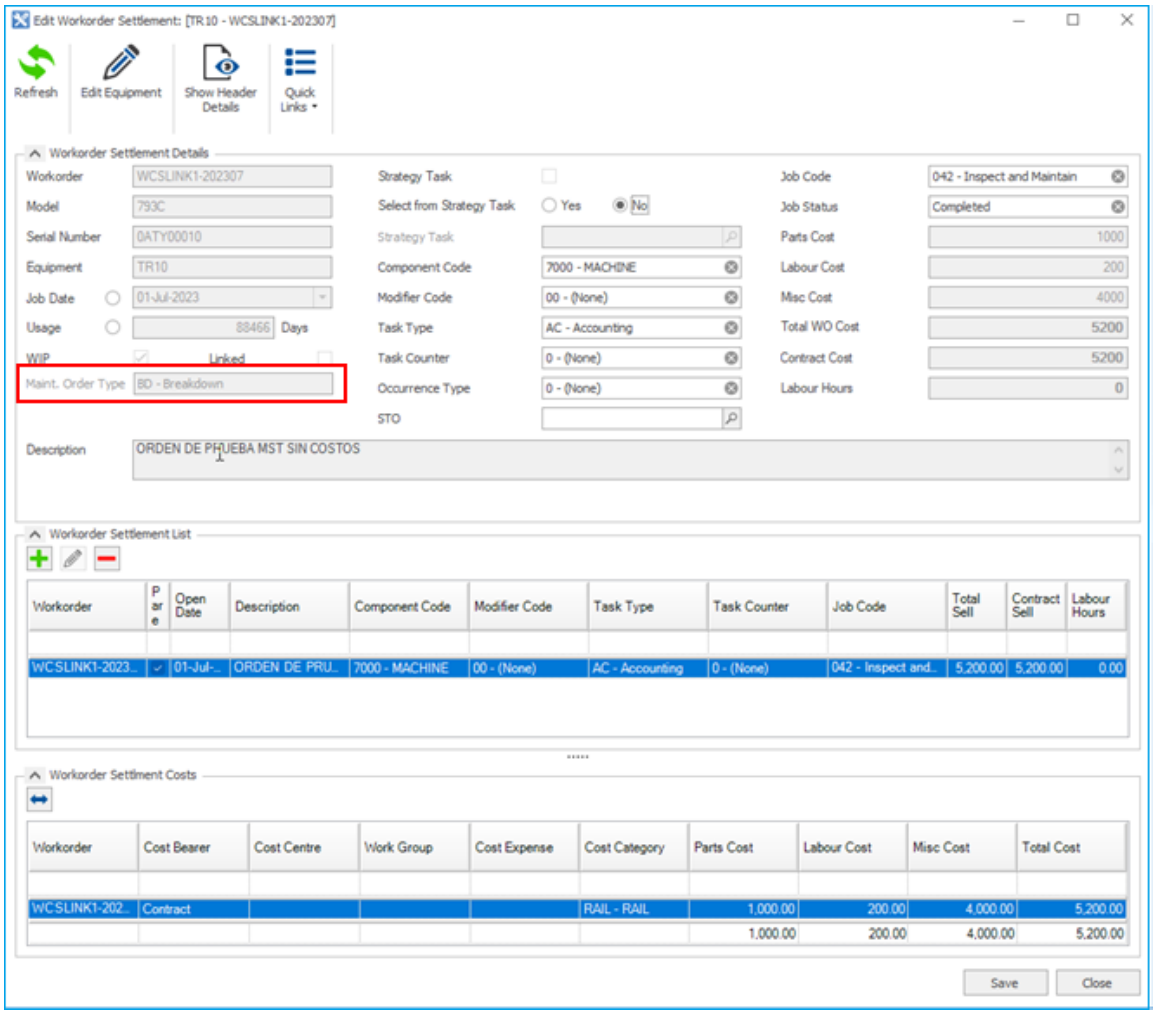

Work Order Settlement Manager

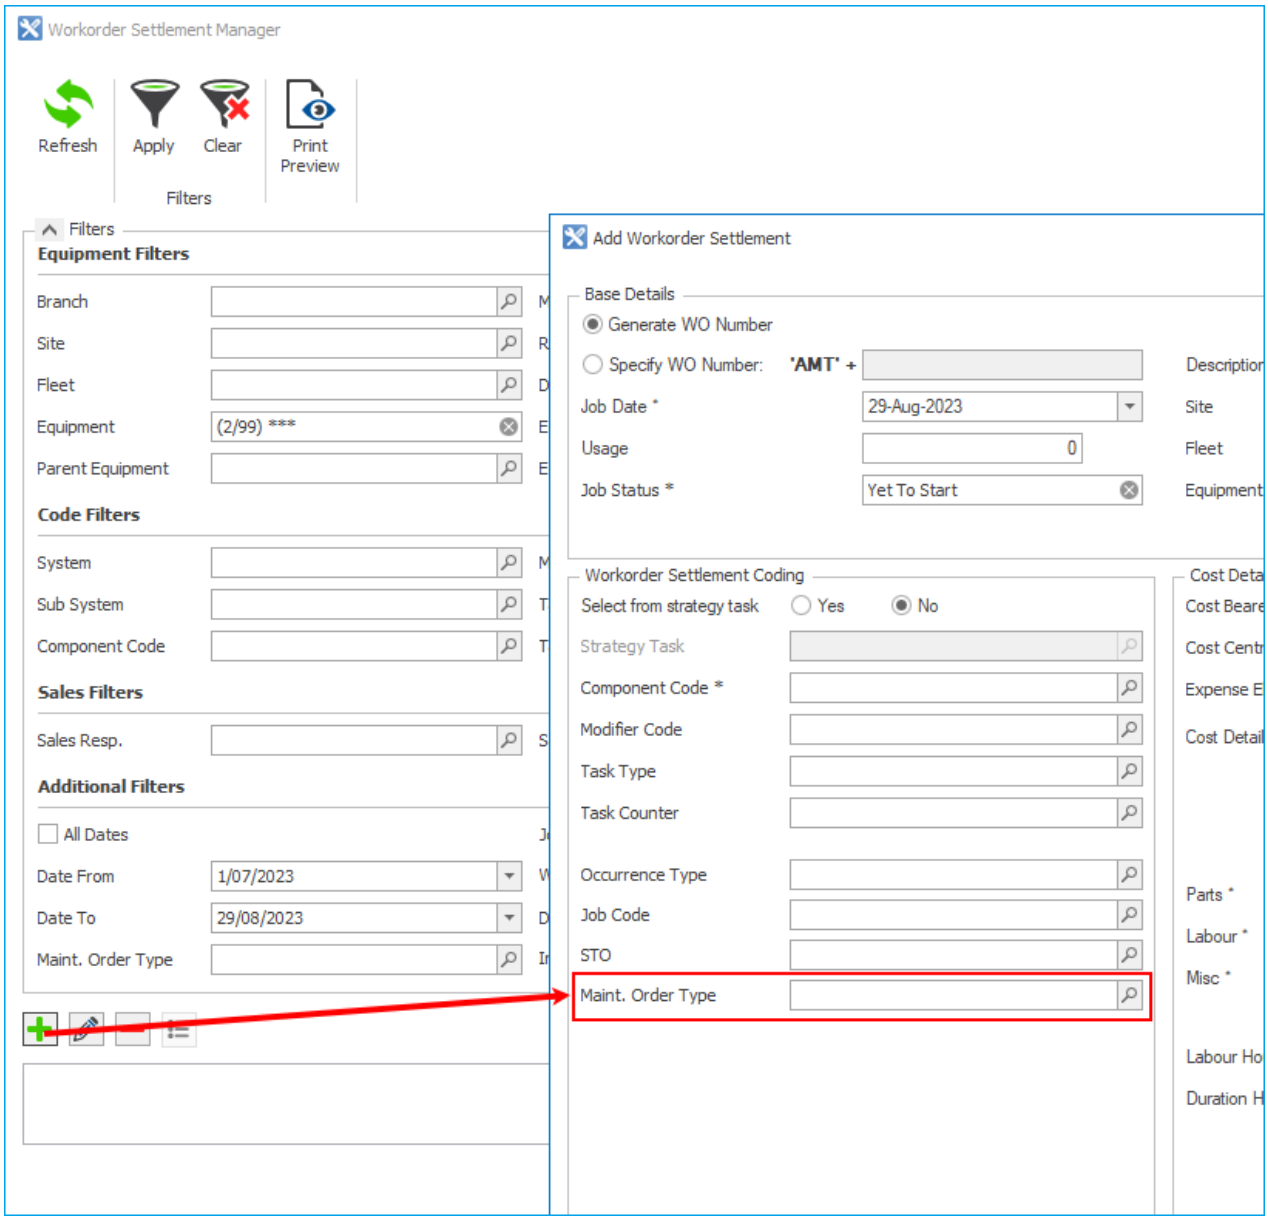

The **Work Order Settlement** function has a new filter added for **Maintenance Order Type**. The filter allows selection of multiple values. The display fields list has also been changed to allow inclusion of the MOT field in the results grid.

The detail view of work order settlements has been changed to include the MOT field. If the work order settlement was created manually by the AMT user, the MOT code can be edited on the settlement detail screen. If the settlement is created from an external system, the MOT code will be read only. If the work order settlement is linked to an AMT planning work order, the MOT code will be read only and will come from the linked planning work order.

Cost Analysis – Life Cycle report

The **Cost Analysis – Life Cycle** report has had a new filter added for **MOT**. The filter allows selection of multiple values.

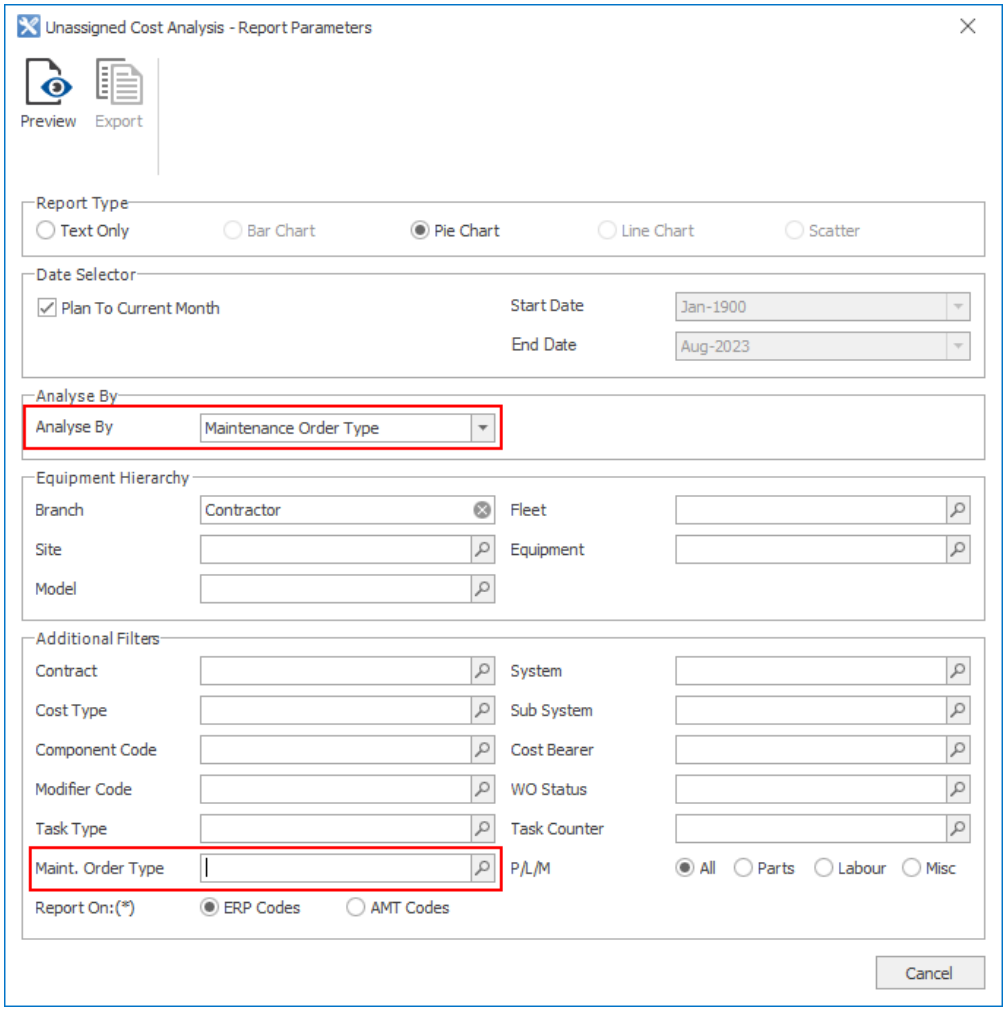

The costs in the report can be analysed by MOT.

Unassigned Cost Analysis report

The **Unassigned Cost Analysis** report has had a new filter added for MOT. The filter allows selection of multiple values.

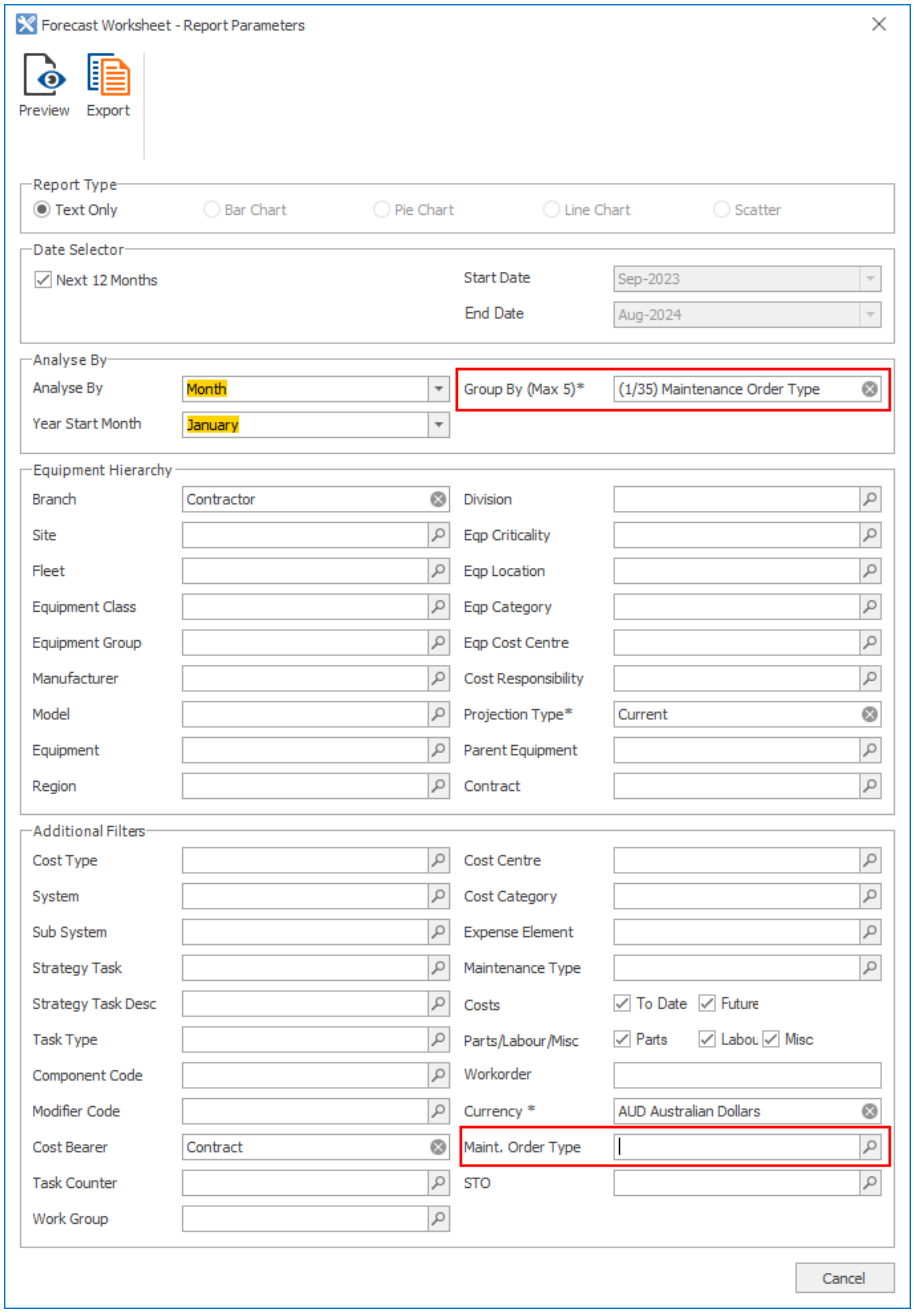

The costs in the report can now be analysed by **MOT**.

Forecast Worksheet report

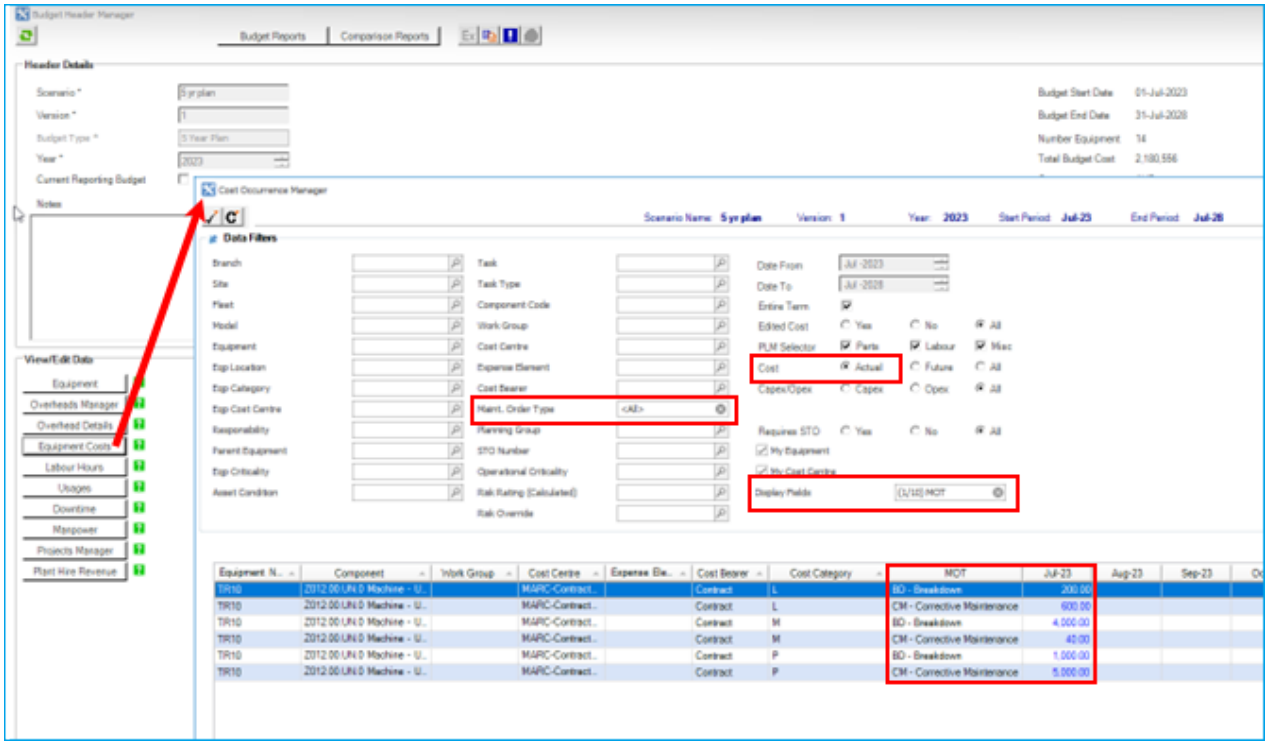

The **Forecast Worksheet** report has had a new filter added for **MOT**. The filter allows selection of multiple values.

The costs in the report can be grouped by MOT to assist with analysing costs by MOT.

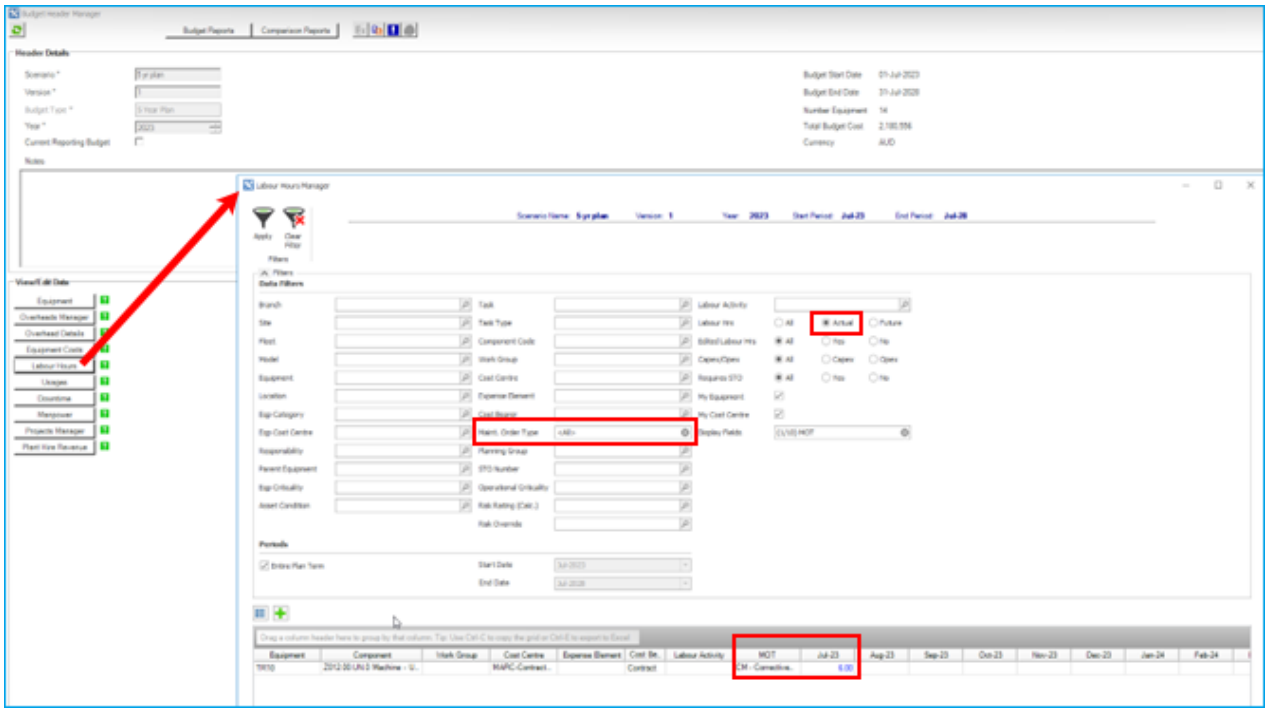

Budget and Forecast Manager

Within the **Budget and Forecast Manager** function, in the **Equipment Costs** sub-function, the **MOT** filter is now applied to actual costs using the new MOT field on the work order settlements.

Within the **Budget and Forecast Manager** function, in the **Labour Hours** sub-function, the MOT filter is now applied to actual costs using the new **MOT** field on the work order settlements.

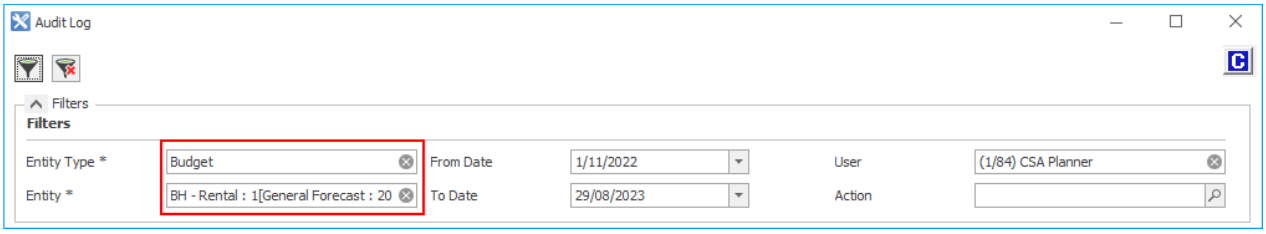

Data Model changes

The following **Data Models** have been enhanced to include the **MOT** key referencing **SystemTablesDatamodel.MaintenanceOrderType**:

- WorkorderDataModel.ParentWorkorderSettlement
- CostsDataModel.Cost
- CostsDataModel.ActualCost
- CostsDataModel.FutureCost
- OccurrencesDataModel.ActualOccurrence
- OccurrencesDataModel.FutureOccurrence
- OccurrencesDataModel.Occurrence
- BudgetVsActualDataModel.BudgetCost
- BudgetVsActualDataModel.ActualCost

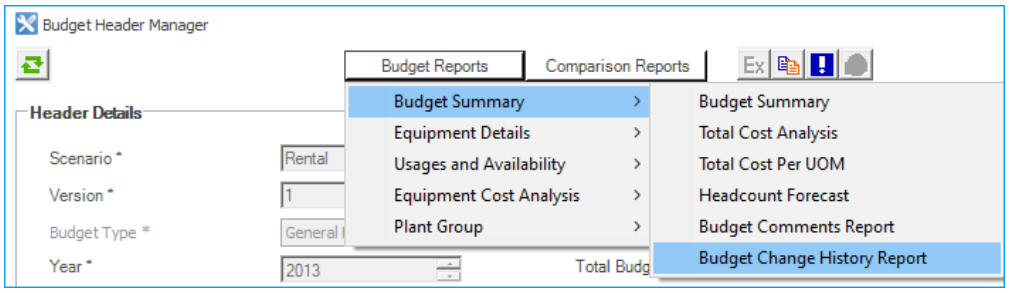

Budget Change History

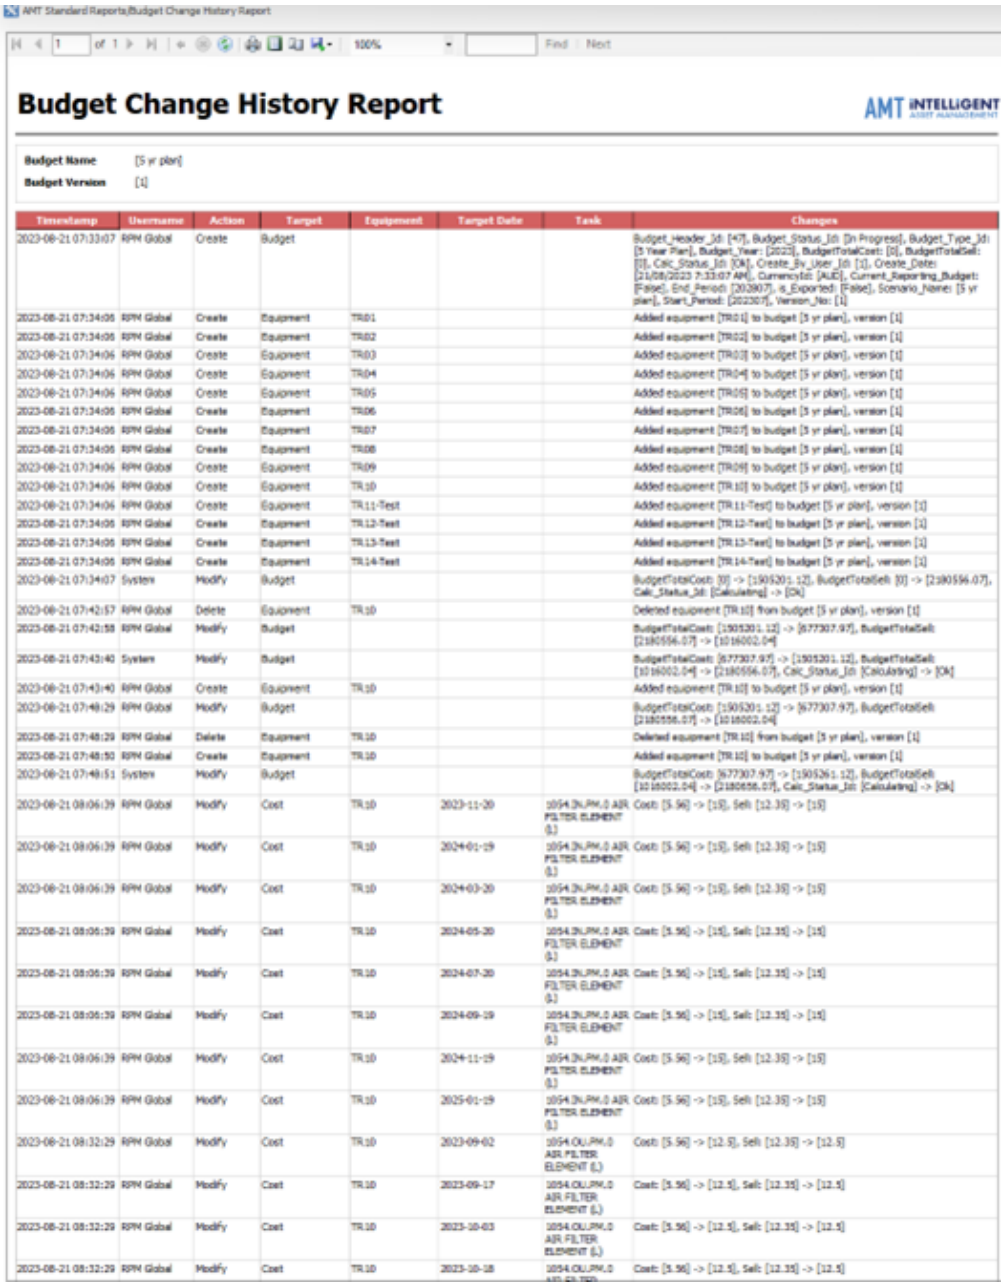

Universal Logging in AMT has been extended to cover changes in budgets, providing the ability to see who changed the budget details over time. The budget **Audit Log** data is available for review in the standard Audit Log function.

Budget Change History Report

A new report is available in the Budget Header Manager, under the **Budget Report** > **Budget Summary**. The Budget Change History Report lists the audit changes to the budget.

Budget Change History data model

A new data model is available over the audit data for budgeting to allow customers to write custom reports. The data model is called **BudgetingDataModel.BudgetHistory**.

Logging

Budget Logging Service

Due to the amount of data which can be updated for budget changes, the audit logging functionality is facilitated by a new AMT Windows service called **Amt.Budget.Log.Service**.

Work Order Settlement logging

Changes to **Work Order Settlements** are now available for review in the standard **Audit Log** function.

Equipment logging

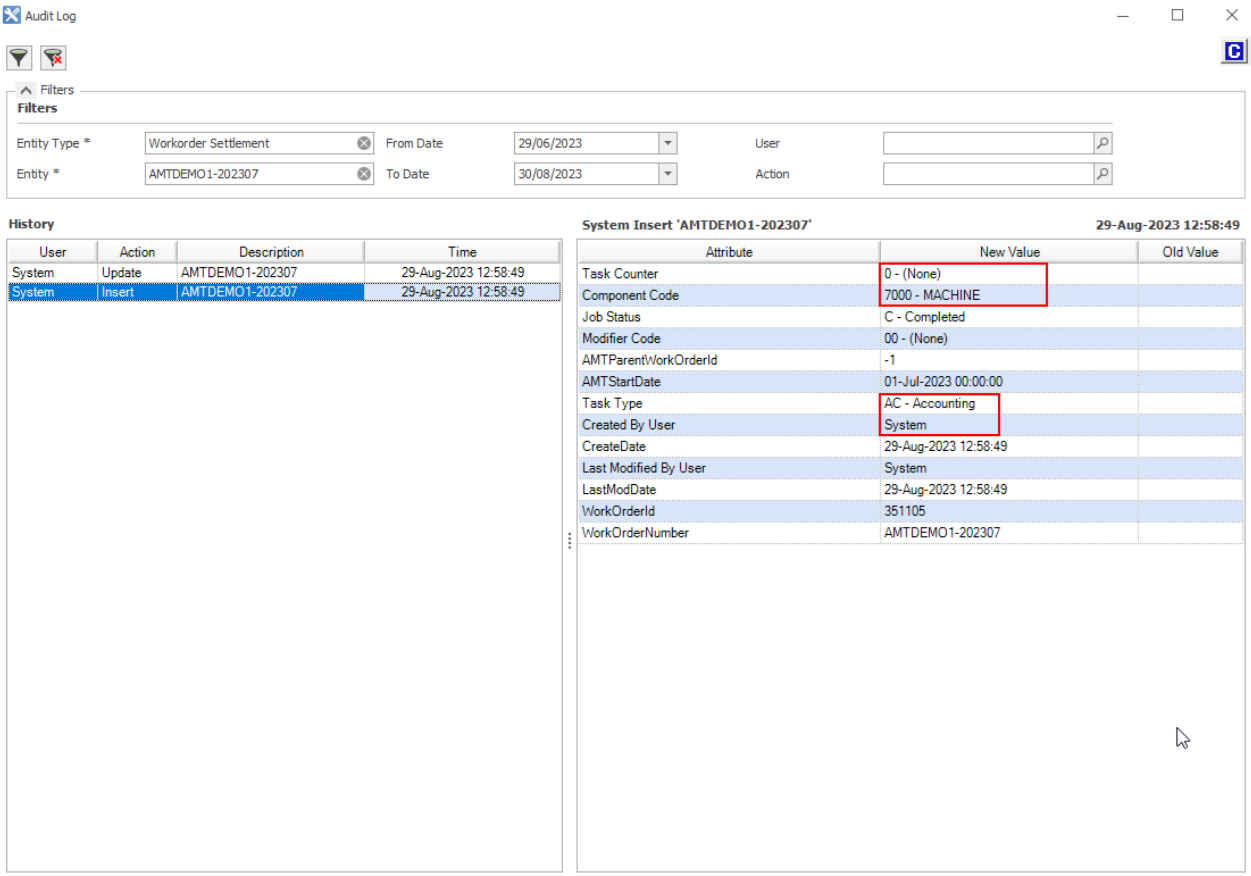

Changes to **Equipment** are now available for review in the standard **Audit Log** function.

Strategy Task logging

Changes to **Strategy Tasks** are now available for review in the standard **Audit Log** function.

Universal logging extensions

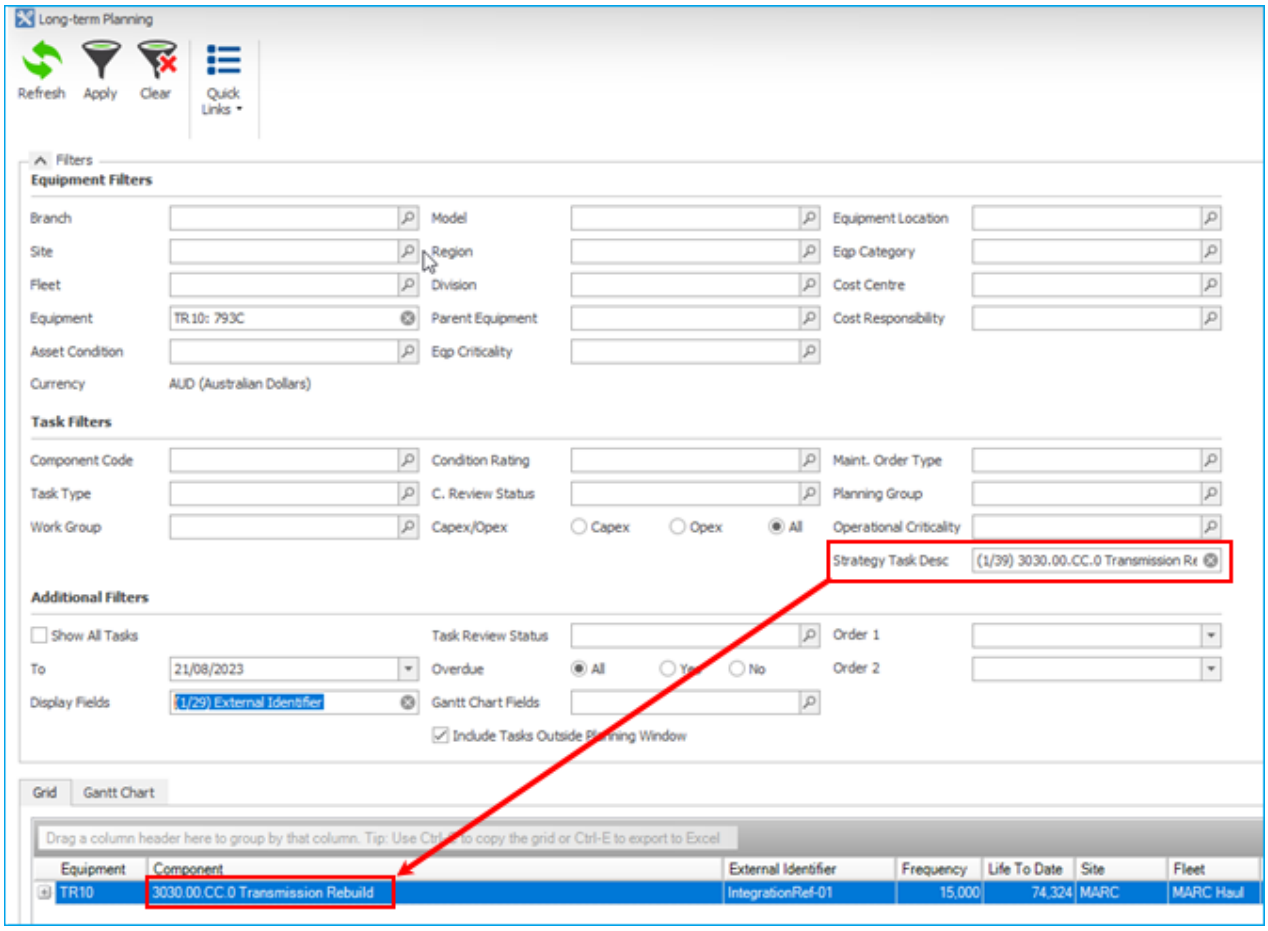

The **Audit Log** function has been enhanced to display attribute values for **Data IDs** instead of displaying the ID.

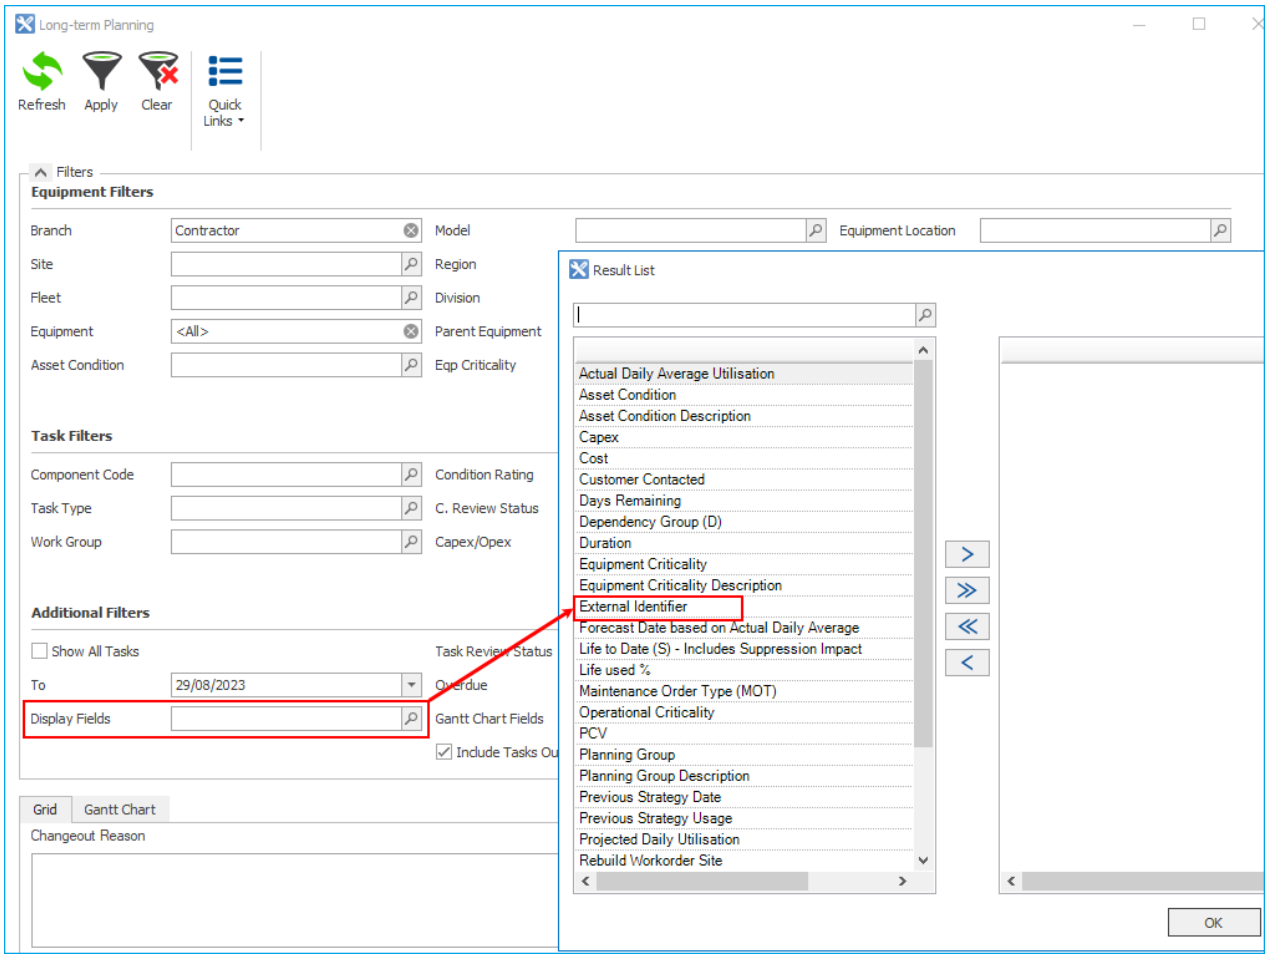

Additional filters and display fields for managing strategies

Long-term Planning

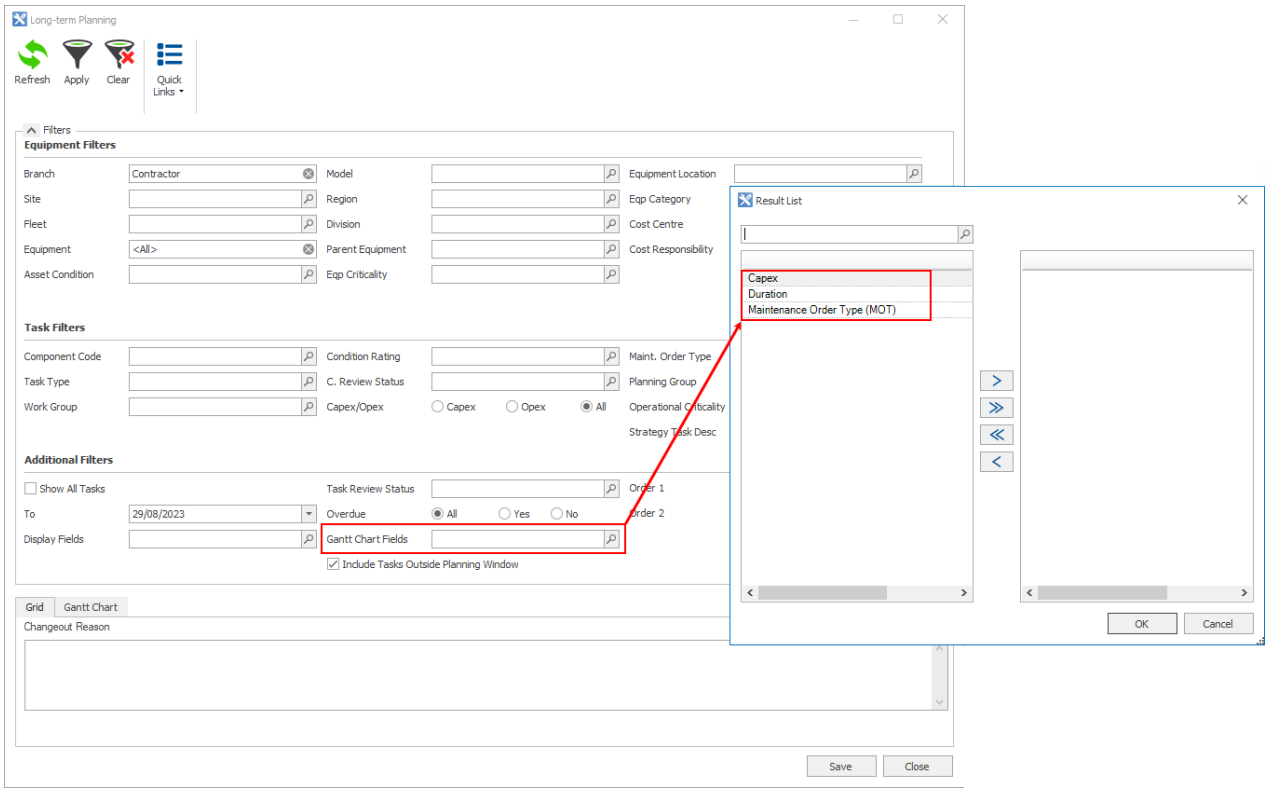

The **Long-term Planning** function has been enhanced with an additional **Strategy Desc** filter.

Strategy Task Manager

The **Strategy Task Manager** function has been enhanced to add a new filter for the **Strategy Task Description**.

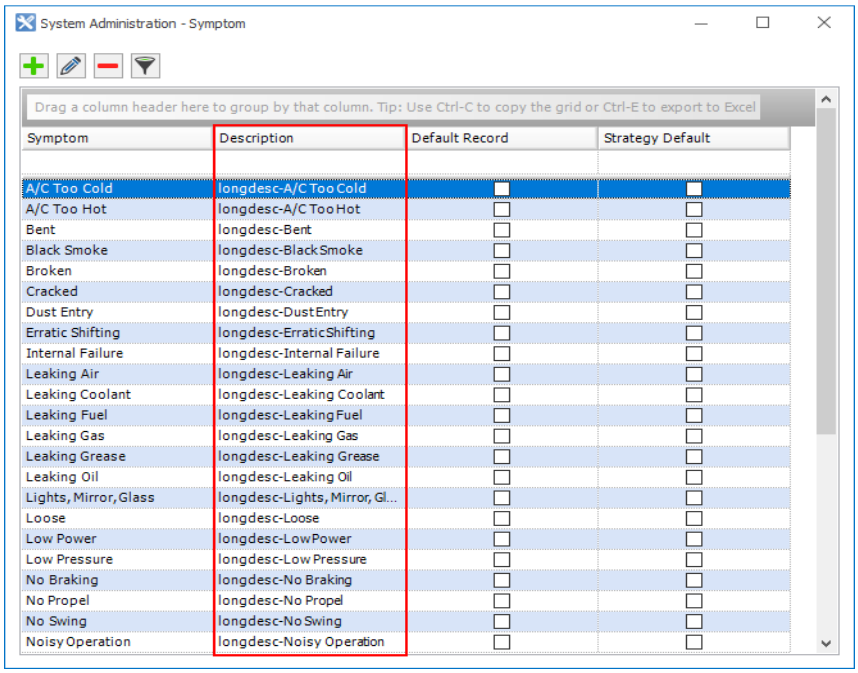

Ability to bulk set Strategy Task to System Calculated

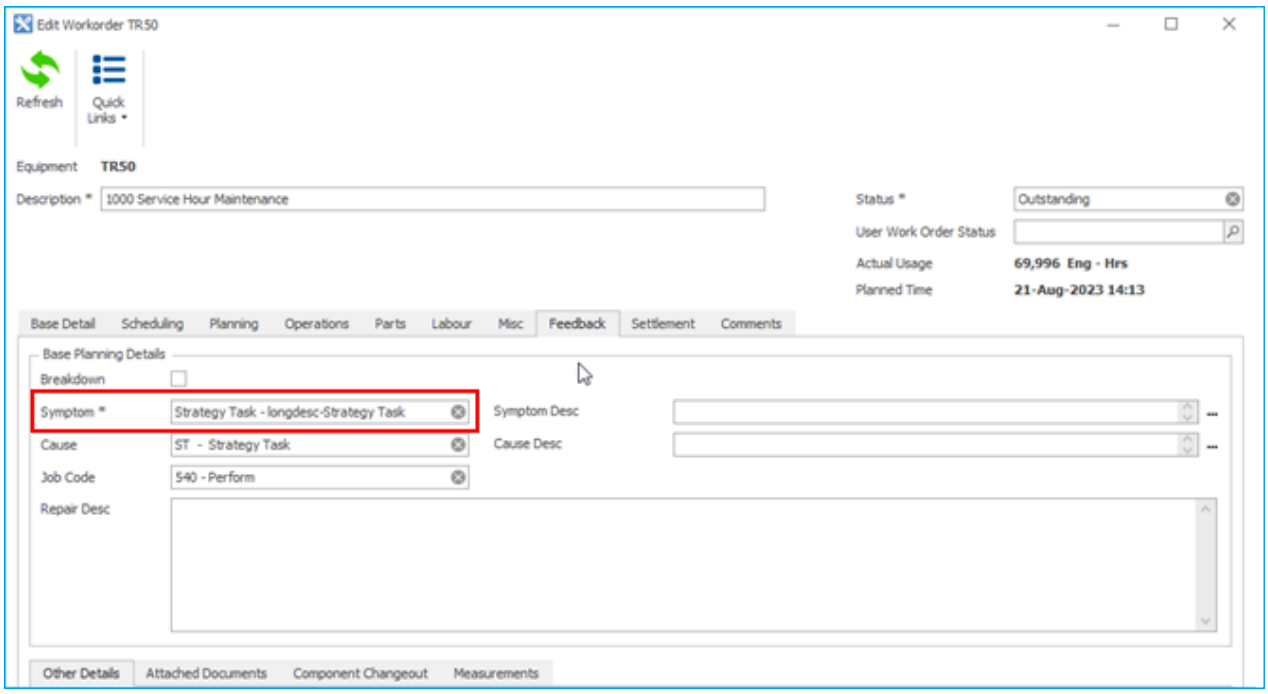

The **Long-term Planning** and **Long-term Planning Advanced** functions have been enhanced to allow selection of multiple rows in the results grid, then right-clicking and selecting the new option to change the next due to **Set to System Calculated**. Using this option will set the selected strategies next due occurrence to system calculated.

Add System Description to System Editor

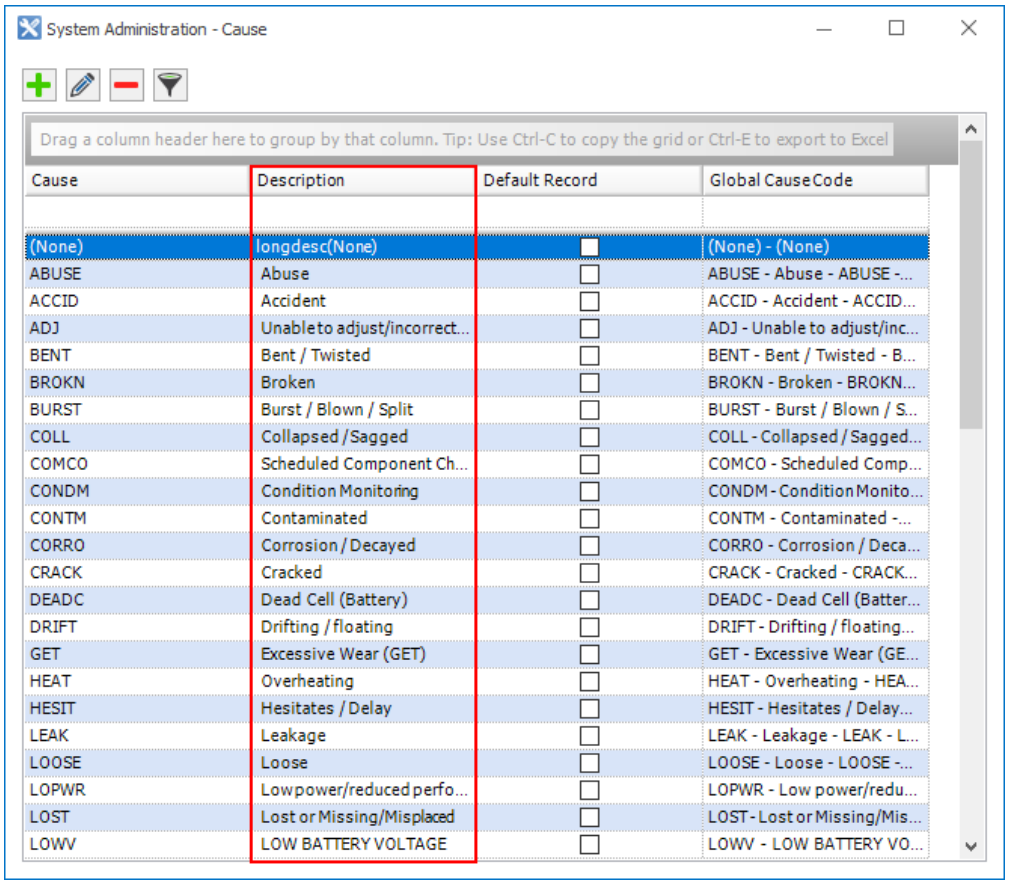

The **Symptom System Table** has been enhanced to have a **Description** field available. This effectively makes the existing Symptom value a Symptom code. The **Feedback** tab on the **Work Order Editor** has been updated to show a code and description for the Symptom.

Add Cause Description to System Editor

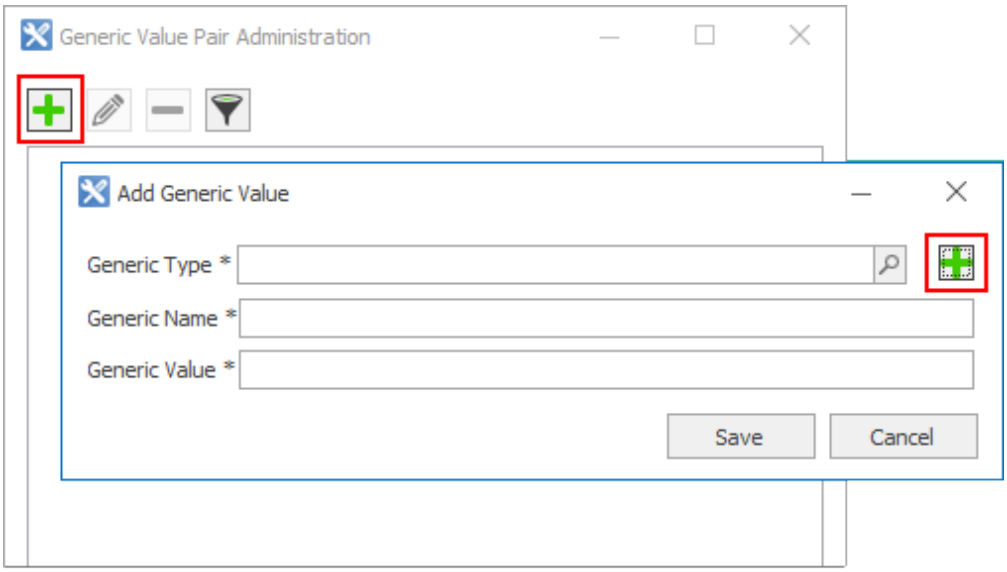

The **Cause System Table** for code has been enhanced to have a Description field available. This effectively makes the existing Cause value a Cause code. The **Feedback** tab on the **Work Order Editor** has been updated to show a code and description for the Cause.

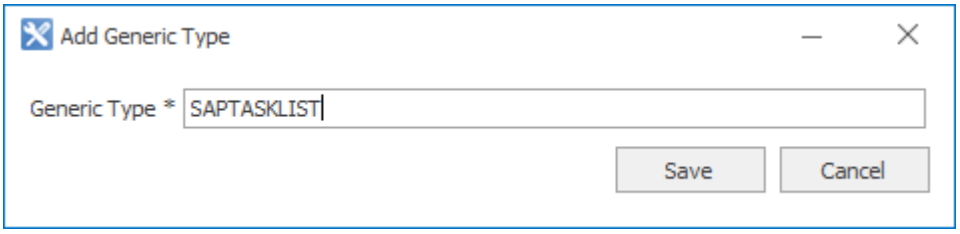

Generic Value Pairs

To enable a generic way to link data in AMT to an external system, **Generic Value Pair** functionality has been added to AMT. A new AMT function called **Generic Value Pair Administration** allows the user to define new types of generic value pairs and then to populate the mapping data between the data in the value pair. As an example, a new type might be called SAPTASKLIST to provide a mapping between SAP task lists and AMT checklists to be used when executing the SAP task list (Strategy Task) in AMT. The following shows how to do this example.

1. Open **System Administration** > **AMT Utilities** > **Generic Value Pairs** and click  to a new pairing of data.
2. Initially the new **Generic Type** won't exist, so click  on to create a new type.

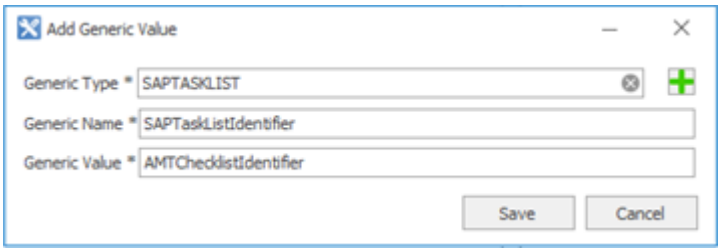

3. Add the new **Generic Type** and click **Save**.

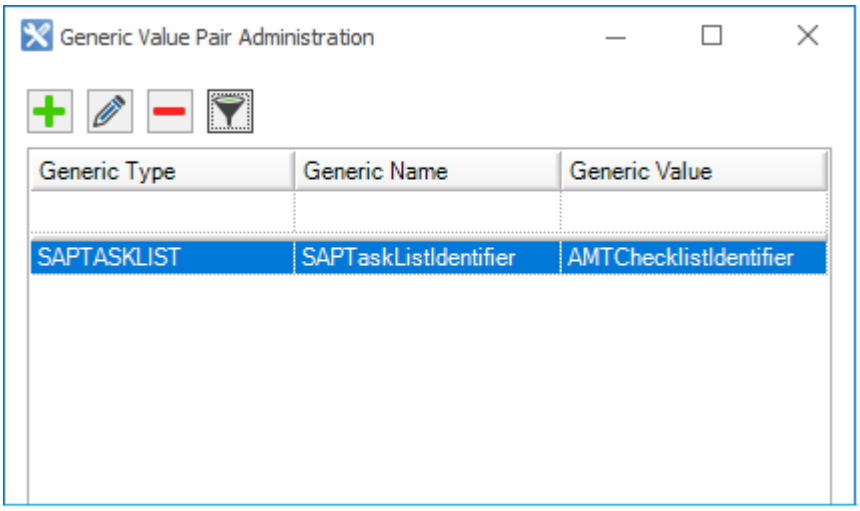

The new **Generic Type** is now available on the **Add** dialog.

4. Add the required **Generic Name** and **Value** to be paired for this Generic Type and click **Save**.

AMT now has data that can be used to link the SAP task list identifier to an AMT checklist.

The initial functionality will only allow one pair of generic name and value for a generic type. In the example provided that would mean only one checklist could be mapped to a given SAP task list.

Azure Active Directory configuration

Configuration for Azure Active Directory authentication has been extended for web and mobile. The following variables have been added to AMT_TYPED_VARIABLE to facilitate AAD authentication for web and mobile.

- AmtCloudAzureWebMobileClientId
- AmtCloudAzureScope
- AmtCloudAzureMobileRedirectUri
- AmtCloudAzureWebRedirectUri
- AmtCloudAzureWebPostLogoutRedirectUri

In addition to the above enhancements, AMT 8.25 includes technical improvements for performance, memory management and an upgrade to the **Client License Manager**.

Web Enhancements

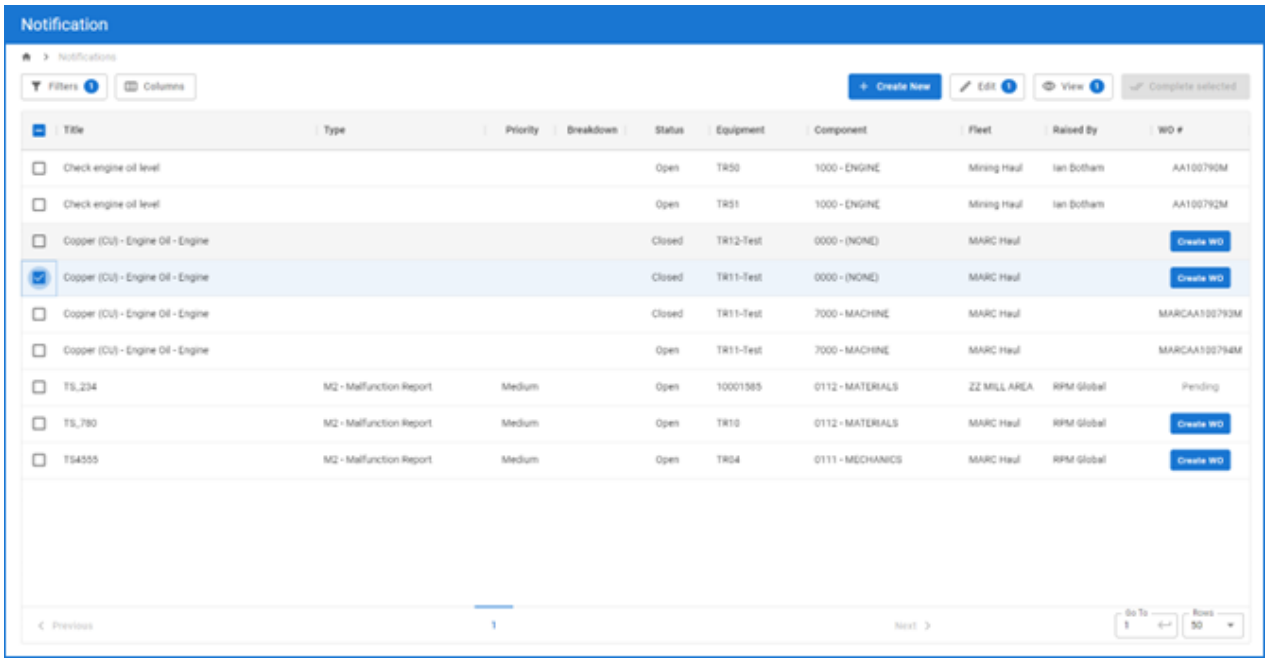

Notification application

The new **Notification** application provides the user with the ability to manage Notifications originating from Mobile, or an ERP.

Notification listing

The **Notification listing** serves as the gateway to the **Notifications** application, presenting users with a comprehensive overview of notifications based on their selected filters and sorting preferences. Through this

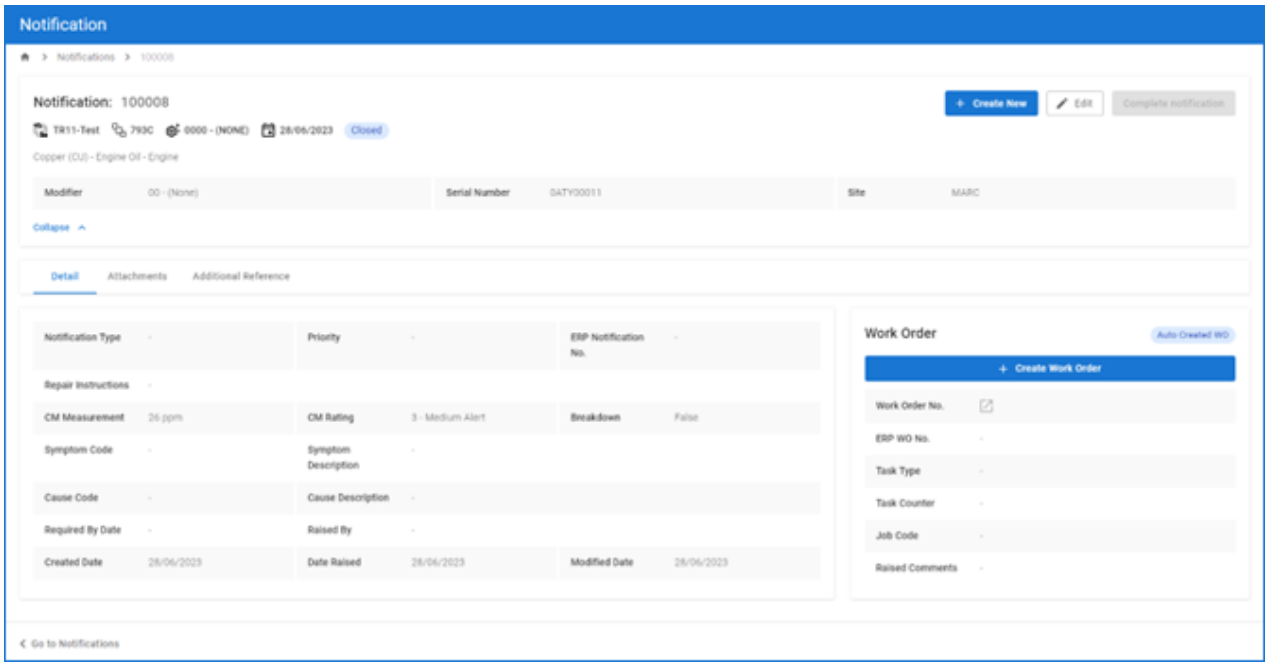

feature, users can easily navigate to individual notifications for viewing and modification, as well as selectively manage a group of notifications.

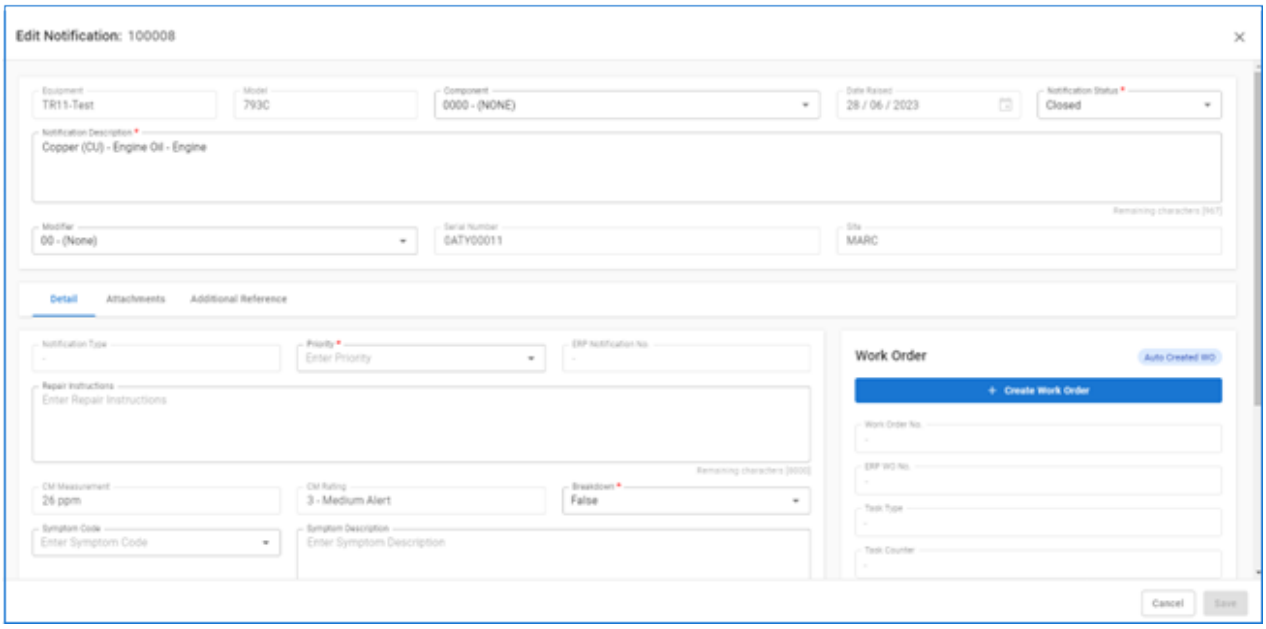

Users

Notification Detail

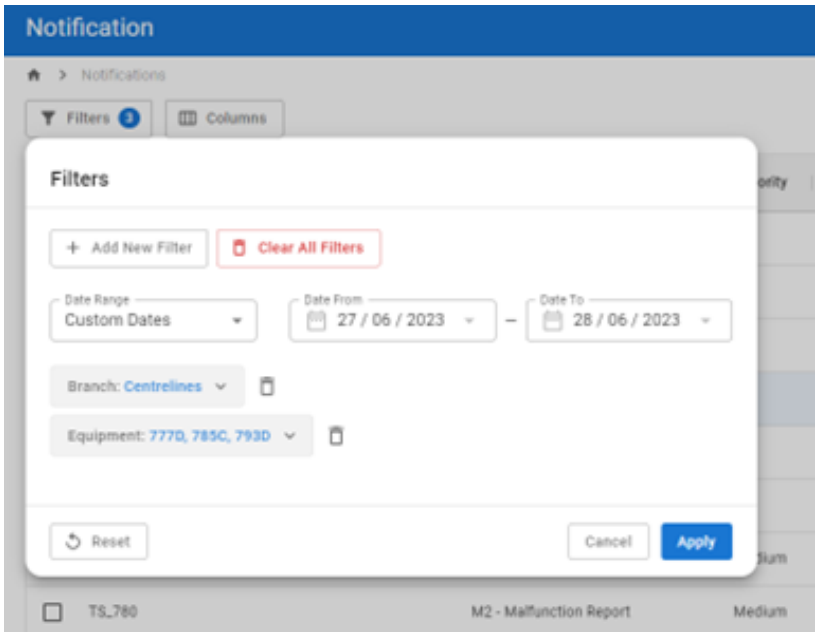

On the **Notification Detail** screen, users have the ability to both **View** and **Modify** a notification. This interface not only presents the specific details of a notification, but also displays any associated attachments and relevant reference data. Additionally, users can complete the notification directly from this screen. The Notification Detail screen also offers visibility into any created work orders, and enables users to generate a new work order if none exist yet.

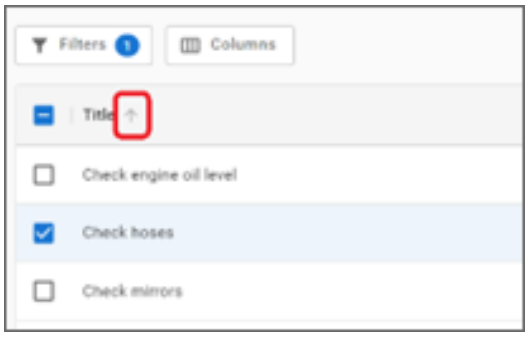

Filtering and Sorting

To enhance the filtering capabilities of the notification listing, users can choose from a variety of filtering options. These include the ability to filter by a predefined date range, such as today, yesterday, or the past 7 days, as well as the flexibility to specify a custom date range. Furthermore, users can apply filters based on specific notification data fields, such as branch, site, fleet, and more. Once the filters have been applied, the resulting records are presented in a paginated list based on the number of notification records.

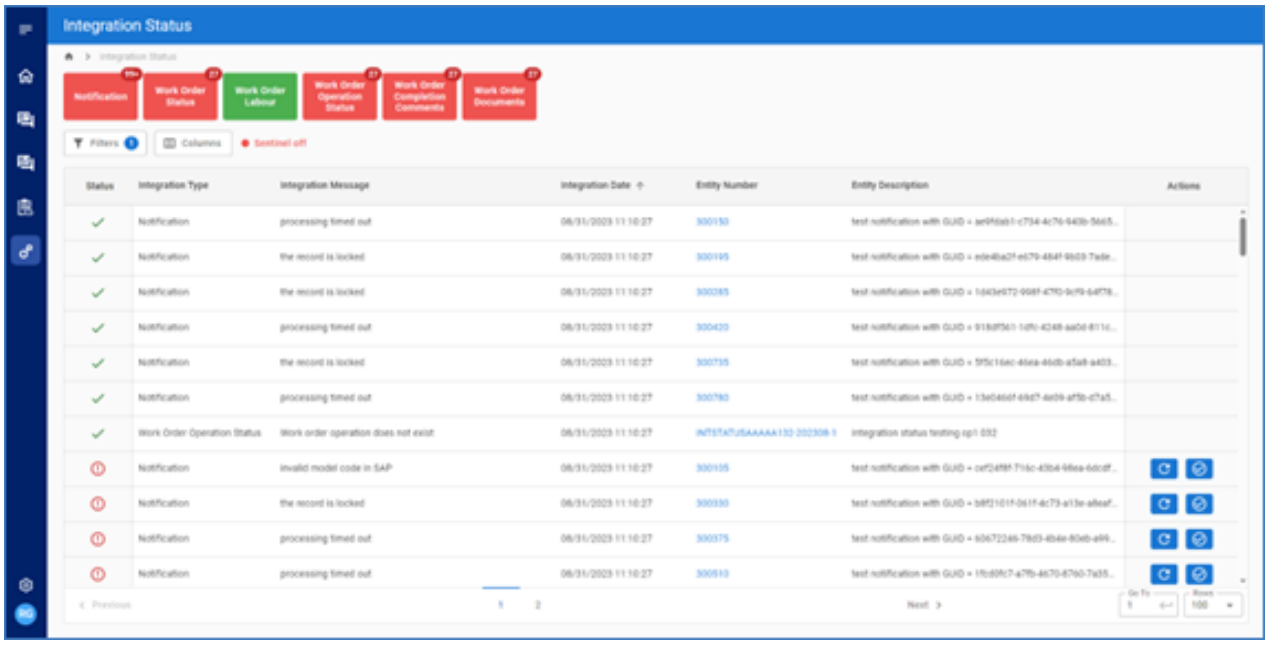

Users can also sort records from the column headers of the notification listing grid.

Integration Status application

The **Integration Status** application provides users with the capability to monitor and manage system integrations from AMT. More specifically it provides:

- visibility of errors and status of integration from AMT to other systems.
- a mechanism to resend failed integration records after the underlying issue has been resolved.
- a mechanism to acknowledge errors where the underlying error can't be resolved or the record does not need to be resent.

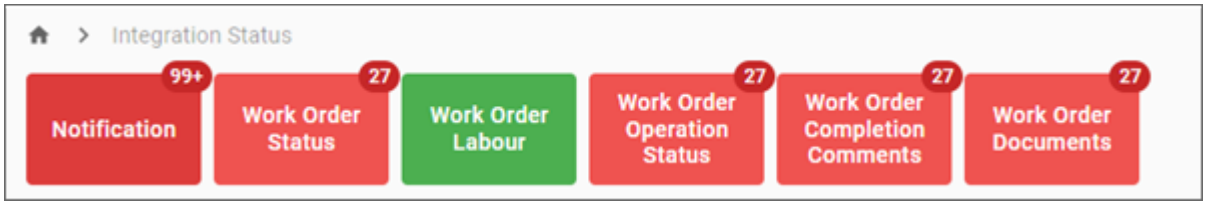

The main window is broken down into three main major sections:

- **Quick Filter tiles**: Allows users to quickly filter transactions to view failed transactions for a particular integration.
- **Filter bar**: Functionality for filtering and viewing columns in the grid, but also includes the status of the integration processes.
- **Transaction grid**: Allows users to monitor integration transactions and either acknowledge or rerun failed transactions.

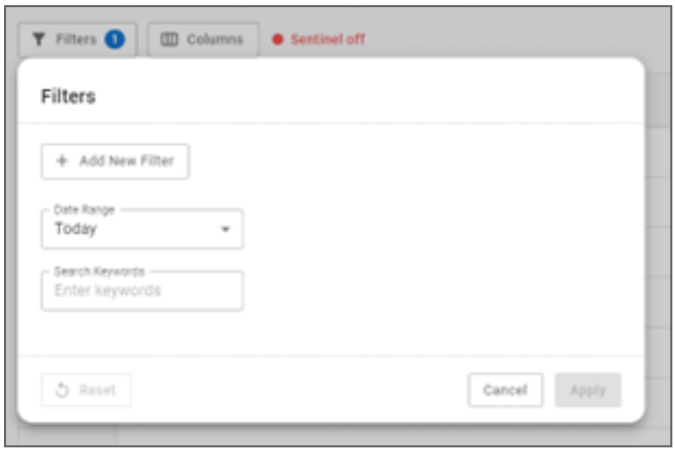

Quick Filter tiles

Each tile will display as either **Red** or **Green**; Red if errors exist or Green if no errors exist for the integration. The number of errors is clearly displayed in the badge at the top right of the tile.

Filter bar

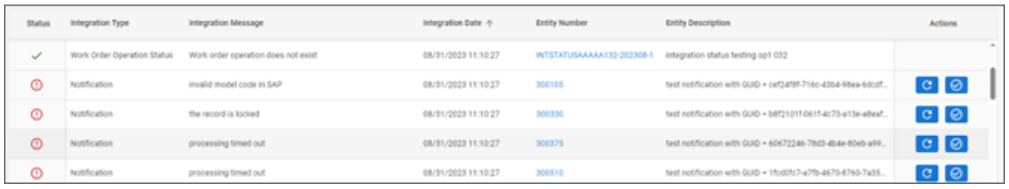

The user can filter by a large selection of criteria including date, keyword search, status, integration type, branch, site fleet and equipment.

Transaction grid

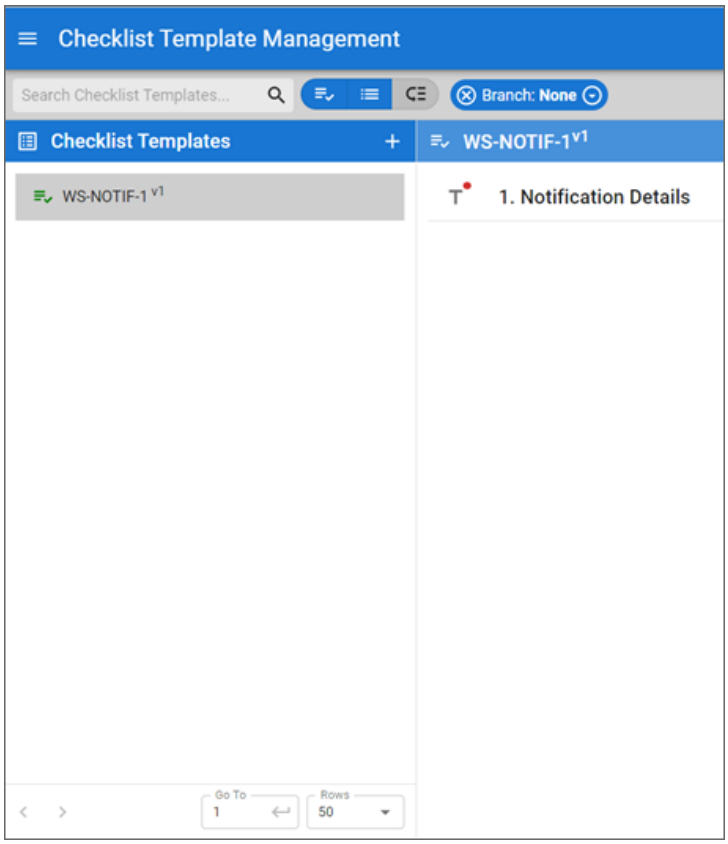

The **Transaction grid** shows the results of any filters set. It enables the user to easily see the status of each transaction, and also allows the user to sort by any field within the grid. Users can rerun failed transactions once the underlying cause has been dealt with. The user can also acknowledge failed transactions, meaning they will no longer be considered an error, and no further processing will occur.

Links to related **entities** (that is, **Notifications** or **Work Orders**) allow the user to navigate to the **Notifications** app (see above) or the **AMT Desktop** application in the case of work orders.

Checklist Template Management application

A number of enhancements have been implemented for the **Checklist Template Management** application, including improvements in pagination, sorting and filtering.

Pagination

The user now has the ability to set the size of the page of the checklist templates being displayed in the list.

Filtering and Sorting

The sort order of the list of checklist templates has been changed to **checklist template name**, displaying in alphabetical order. Tag filters now use '**AND**' logic rather than '**OR**', enabling the user to perform better filtering of templates.

UOM Question

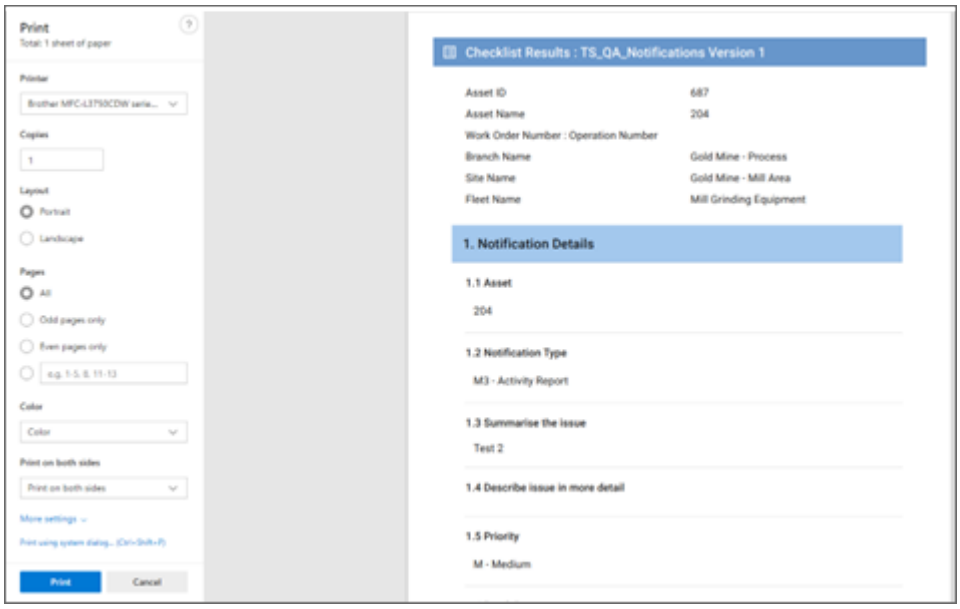

The **Unit of Measure** question now allows the user to choose an **Allow History** setting, resulting in measurements being displayed within the checklist on the mobile device.

Checklist Results application

The **Checklist Results** application has had a minor fix to the printing capability including:

- Printing page-breaks are now avoided within checklist result questions.
- Buttons are hidden when printing checklist result questions.
- Improved checklist result detail presentation.

Common Components

Global theme updates

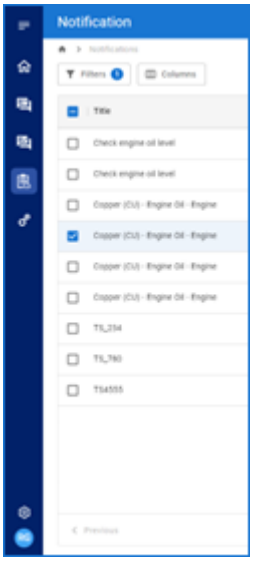

The styling for AMT Web is achieved through the use of a global theme. Major theme updates have occurred to bring AMT Web into line with the RPM Global common designs used for web applications. These theme updates include:

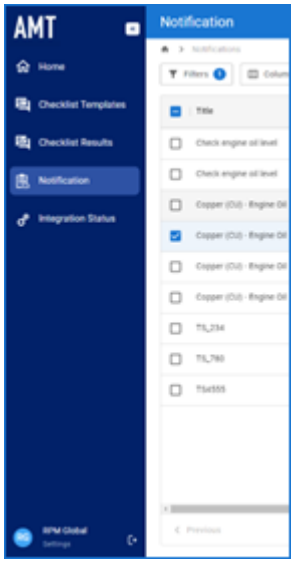

- Improvements to general alignment, fonts, colours and layouts.
- Consistency for all dialogues incorporating new rounded design.
- Improvements to Dark theme.
- Input fields are now contained and consistent across all input forms.

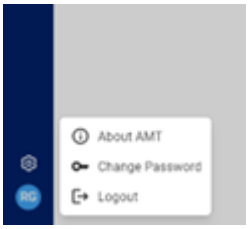

Navigation menu

The new RPM Global common rail menu has been incorporated into the web application. The rail menu gives a more vertical navigation experience for the user and gives easier access to other applications and general

functions.

React Router upgrade to version 6

React Router is a popular library for building navigation and routing in React applications. The latest version of React Router, version 6, has several significant changes compared to version 5. Upgrading to version 6 comes with several benefits such as improved performance, better type safety, and a cleaner, more modern API.

One of the biggest changes in version 6 is the removal of the static route configuration approach used in previous versions. Instead, version 6 uses a new approach called "routes as components," which allows you to define routes as React components. This provides more flexibility and composability in defining routing in AMT Web, as well as better type safety and the ability to use React hooks in our route components.

Overall, upgrading to React Router version 6 did require some refactoring, but it offers several benefits that made it worthwhile.

Fixes

Functional Area	Fix	Work Item	Case ID
Client			

Functional Area	Fix	Work Item	Case ID
Audit Logging	Fixed an issue with inconsistent display format for date and time fields.	51559	
	Fixed a date time conversion error in **Audit Log** and **Audit Log Report**.	56010	167611
	The **Audit Log** function now always launches correctly.	56650	
	Fix to **Audit Log** for budget data to display the user making changes instead of displaying the system user.	57421	
	Fixed an issue where audit logging was impacting recalc and replanning.	58103	
	Fixed an issue where the **Audit Log Report** did not always display all the Audit Log details.	58298	170783
	Fixed a timeout issue when searching in **Audit Log** function and **Audit Log Report** .	58634	
	Fix to stop data truncation in **Audit Log** and **Audit Log Report** .	61518	
	Improved the performance of **Audit Log** and **Audit Log Report**.	62168	

Functional Area	Fix	Work Item	Case ID
Budgeting	Fixed the error **Please select FY YTD Month** when running the **Functional Location Budget v Actual Analysis** report.	52019	166317

Functional Area	Fix	Work Item	Case ID
	Fixed an issue where the **Expense Element** filter was not applied to **Unassigned**, **LDST** and **FFDST** tasks in the budget.	52054	166334

Functional Area	Fix	Work Item	Case ID
	Fixed an issue where the **Cost Category** column heading was missing from the Results grid in **Cost Occurrence Manager**.	52071	166455
	Fixed the **Budget Summary Report** so the **Notes** section handles new line characters correctly.	52105	166474
	Fix to **Cost Occurrences Manager** so that changes to the **Risk Override** trigger a **Save Changes** dialog.	52273	166458
	Fixed the issue where **Replace Actual Costs to Month** on **Budget Equipment Manager** was creating duplicate actual costs in other budgets.	53048	167079
	In **Budget and Forecast Manager**, the **MOT** filter results list to show only MOT codes in the budget.	56908	
	Adding **Actual Labour Hours** no longer raises an error.	56912	
	Filtering **Cost Occurrence Manager** by **STO** no longer raises an error.	57335	169856
	Fixed an issue where copying values from the grid in **Cost Occurrence Manager** to **Excel** was shuffling some columns.	57351	169710
	Improved the performance of adding new Equipment to the budget.	58845	
	Improve the performance of replacing Actual Costs in the budget.	58933	
	The **Strategy Task** and **Strategy Task Description** columns in the **Equipment Cost Analysis** report no longer shows the same data when copying reports	59438	171753
	The **Budget vs Current Projection Details** report no longer displays the message **Unsafe Search Term**.	62115	
	The **Budget Equipment Editor** now shows the correct **End Date**.	59532	171752

Functional Area	Fix	Work Item	Case ID
Builder	Fixed a regional issue where importing files with numbers was using commas instead of period for decimals.	58398	166922
Bulk Printing	Fixed a problem where the **Bulk Printing** function was not showing the confirmation message before starting the print process	52658	166916
	Fixed an issue where **Job Folders – Bulk Printing** was unable to print documents from the AMT Library.	53256	166917
	There is no longer an issue with **Bulk Printing** PDFs.	58882	170999
	Changed **Bulk Printing** to allow users to continue to print if the attached file or path is not found.	59122	
Condition Based Monitoring (CBM)	Fixed AMT so that notifications and work orders created from condition monitoring and CBM rules will use the setting for **DefaultCBMAlertTaslCounterId** to determine which task counter is used when creating notifications and work orders. Customers using condition measurements and CBM should review the setting for DefaultCBMAlertTaslCounterId with their technical consultant. If the customers want the behaviour of AMT to remain as is, the setting for DefaultCBMAlertTaslCounterId could be set to the ID of the system default task counter.	55943	
	Fixed an issue where CBM was not emailing notifications.	59341	171714
Data Models	Changed **StrategyTaskDataModel.StrategyTask** to now include Strategy Tasks that have just been created and haven't yet been processed by recalc.	59900	172331
	BudgetVsActualDataModel.ActualUsage now shows the correct Period Usage.	57867	170445

Functional Area	Fix	Work Item	Case ID
	BudgetvsActualDataModels now uses the correct shutdown details. The following data models are affected: • BudgetVsActualDataModel.BudgetCost • BudgetVsActualDataModel.BudgetLabourHours • BudgetVsActualDataModel.ActualCos • BudgetVsActualDataModel.ActualLabourHours	57333	169857
	Improved performance on the data model for **UniversalLoggingDataModel.AuditLogEvent**.	59370	171830
DLCC	Fixed an issue where **DLCC** is sometimes locked by another process which checks if projection requires calculation.	54124	167226
	Fixed an issue to stop **DLCC** constantly re-creating accrual settlements.	54167	167435
	Improved the performance of work order settlement merging.	59020	171413
	Fixed an issue where **DLCC** does not calculating projections manually set to recalculate in **Recalc Manager**.	59826	
	Fix an issue where **DLCC** is raising errors when calculating strategy tasks in scheduling groups with mixed UOMs .	59996	
	Fixed an issue where **DLCC** sometimes does not calculate all tasks in scheduling groups.	52237	166379
	DLCC no longer calculates the first occurrence incorrectly in sibling suppression groups.	53003	167049 171503

Functional Area	Fix	Work Item	Case ID
Equipment	**Equipment Administration** no longer throws an exception when the number of Tech Fields exceeds 100.	58590	171242
	Improved the performance in **Equipment Editor** when saving minor changes to multiple strategy tasks.	58890	171242
	Fixed an issue that stops users deleting equipment when the equipment has a strategy task linked to a work order. Fixed an issue that stops the **Multi-Equipment Delete Task** when the task has a linked work order.	62211	
	Fixed centreline equipment so that **Term Start Date** moves to the beginning of each new month.	53228	167171
	Fixed an issue for **Equipment Import** file processing, where the default projection was not generated from the centerline.	62068	174648
Events	Fixed an issue which was causing an exception when using the **Merge Event** functionality.	60353	
IC Import	Fixed **IC Import** so that it runs without a data import exception.	59384	171837
Inventory Search	Fix an issue on the **Part Inventory Search** screen, where **Supplier** and **Source of Supply** are not passed to integration correctly if they contain **-**.	59747	172153

Functional Area	Fix	Work Item	Case ID
Long-term Planning	Fixed an error when preselected equipment does not exist in the **Equipment** drop-down in **Long Term Planning** .	51879	164769
	Fixed an issue where the **Forecast Worksheet Report** did not work when filtering by **Strategy Task Desc**.	52462	166784
	Fixed an error that was occurring when changing **Edit Next Due** in an occurrence.	53265	
	Fixed an unhandled exception error which occurred when applying filters in **Long-term Planning - Advanced**.	53376	167277
	Fixed an **Arithmetic Overflow error** which occurred when running the **Changeout Forecast Worksheet Report**.	55386	167954
	Fixed an **Arithmetic Overflow** error which occurred when applying filters in **Long Term Planning - Advanced**.	55386	167954
	Fixed an **Arithmetic Overflow** error which occurred when assigning STO in **Long Term Planning - Advanced**.	55388	167954
	Fixed an issue where the **Long-Term Planning Log** doesn't show all data.	58856	171269
	Fix an issue in **Long Term Planning – Advanced** where setting **Next Scheduled Date** displays an error saying to look in the Event Viewer.	58867	
	Fix an error displayed for **Last_Mod_By_User_ID** when changing the strategy date in both **Long Term Planning** and **Long Term Planning – Advanced**.	58879	
	Fixed an issue in **Long Term Planning – Advanced** where strategy occurrences showed an incorrect work order status.	59075	171437
	Fixed **Long Term Planning** so that sorting the results grid by the **Life Used** column sorts numerically instead of alphabetically.	59476	171912
	Fixed the error which displays when hovering over occurrences in the **Long Term Planning Gantt Chart**.	59543	

Functional Area	Fix	Work Item	Case ID
Maintenance Compliance	Fixed an issue so that new data is now loaded into the IC database and appears in the Maintenance Compliance report.	59902	172311
Next Occ Export	Fixed an unhandled exception error which occurred when using **Next Occ Export** .	53014	
Parts Manager	Fixed **Parts Manager** so that filtering based on **Probability of Min or Max** works correctly.	61274	173558
Parts Usage	Fix an issue where duplicate parts are listed for a work order **Parts Usage** report.	59676	171832
	Fix an issue where filtering the **Part Usage** report by branch or site is not returning correct data.	61675	173980 171606
Parts Demand Analysis	Improved the performance of the **Parts Demand Analysis** report.	50851	164766
	Changed the **Parts Demand Analysis** report to display the message **Cannot return all requested data. Please use the filters to limit the data returned and try again**, instead of showing an out of memory exception.	52456	
Projections	Fixed an issue where, when creating or editing alternate projections in **Equipment Editor**, AMT incorrectly showed a message for exceeding max occurrence.	58192	170526
	Fixed an unhandled error when deleting strategy tasks in **Equipment Editor**.		
	Fix an unhandled error when creating a new projection in the **Equipment Editor**.	59464	
	Fixed the **Projection Summary** report so it loads without error when **Cost Bearer** is selected.	60451	172678 172735
	Fixed an issue where the **Capex** flag not copying correctly when copying projections in **Equipment Editor**.	57328	169653
Quoter	Fixed an error which was being displayed when creating a service agreement quote in Quoter.	62187	

Functional Area	Fix	Work Item	Case ID
Reporting	Improved the performance of the following reports: • **What-if Life Cycle Analysis** • **PCV Chart** • **High Risk** • **High Opportunity** • **Changeout Analysis**	56919	
	Improved the performance of the **Shift Downtime Summary** report.	60359	172244
	Fixed an issue where duplicate line items were appearing in the **Parts Warranty Report**.	59675	171750
	An error no longer displays when using the **Site** filter in various reports.	62375	
	An error no longer displays when using the **Branch** and **Site** filters to run the **Total Cost Worksheet** report	60737	172803
	An error no longer displays when selecting a **Branch** and clicking the **Site** filter on the **Daily Machine performance** check sheet.	61088	173248
SSRS	The **SSRS** system no longer times out.	60706	172344
Standard Jobs	Adding new library documents to a standard job operation no longer displays an error.	52575	
	Fixed an issue where the **Standard Job** wizard creates strategies with a **Days** UOM instead of **Eng Hours**.	57464	168773

Functional Area	Fix	Work Item	Case ID
	Fixed an issue where the **Standard Job Version History** report times out. A new System Task **Process Standard Job History** has been created, running a batch of 100 every 1 minute by default. In order to improve the performance of the **Standard Job History** report, a compromise has been made in that the Standard Job History report has been moved to a system task, which means there might be a delay in changes shown in the report.	58317	170788
	Fixed the fields and how they are shown in the **Display** dialog in **Standard Job Manager**. It now behaves consistently for all languages.	58527	170899
	Fixed the **Standard Job Report** so that **Labour hrs** and **Duration hrs** display with the **Hrs UOM**.	58690	171204
	Fixed the **Standard Job Version History** report to work with when selecting multiple **Price** groups.	58878	
	The **$** symbol has been removed from the **Standard Job Report**.	60504	172734
	Fixed an issue where **CreateStandardJobSnapshot** SQL Agent Job failed.	57298	
STO	Added extra validation to the **STO Manager** so that a proper message ID is displayed when trying to delete an **STO** linked to a budget.	56955	

Functional Area	Fix	Work Item	Case ID
Strategy Tasks	Fixed an issue where the **Risk Rating** calculation was not updating when updating **Operational Criticality** from the **Multi-Task Editor**.	60190	172399
	Fixed a problem where text was getting truncated during the creation of strategy tasks from **Standard Job Import**.	56253	168771
	Improved the performance of **Copy Strategy Task** so it doesn't impact **DLCC**.	58526	170194
	Total Cost in the **Costings** tab for a strategy task now displays the full value for larger amounts.	58639	171131
	Fixed an issue where the Cyrillic characters in **Strategy Tasks** are not imported properly.	58074	170623
	Improved the performance of **Strategy Task Manager** when filtering strategy tasks for **Equipment**.	58908	
	Fixed **Export Strategy** Tasks so Cyrillic characters are processed correctly.	51618	166032
	Fixed a **Divide by Zero** issue when creating **Other Operating Costs** strategy tasks.	52516	166578
	Fixed a bug that stops deleting a strategy task that is linked to a work order.	62091	

Functional Area	Fix	Work Item	Case ID
System Admin	Fixed the AMT installer to correctly set identity **impersonate="false"** in all relevant locations.	58439	
	Updated the AMT installer to correctly handle the double quote character in password.	61684	
	Fixed an issue where an error message to review **Event Viewer** would occur when **adding** a new work group in **Work Group Administration**.	51493	
	Fixed an issue where an error message to review **Event Viewer** would occur when **deleting** a work group in **Work Group Administration**.	56195	168582
	Fixed an issue where valid component codes starting with Z would not display in component code drop-downs across AMT.	54803	164126
	Fixed an unhandled exception when deleting unused **Part Types.**	57034	169316
	Fixed an issue where an error message to review **Event Viewer** would occur when adding a **Sub System** system table.	59000	171393
	SOSIntegrationModule v1.1 now supports Office 365 mailbox OAuth 2 authentication.	59276	171504

Functional Area	Fix	Work Item	Case ID
Translations	When editing the **KPI Targets**grid, AMT now correctly processes decimal numbers for Spanish.	57895	170352
	Enable missing translations for forms in: • Budget Forecast Manager • Budget Header Manager • Equipment • Cost Occurrence Manager • Labour Hours • Downtime • Usage Enable missing translations for **Functional Location Manager** grid headings and **Quick Watch** buttons.	56942	
Usages	Improved the information message displayed when importing usages with the **Invalid Reason** column from the export process.	57188	169579
Users	Corrected an issue where terminated users could still login.	56935	169342

Functional Area	Fix	Work Item	Case ID
Work Orders	Applied a fix so that a non-strategy task work orders can be added to **STO** in **Work Order Editor**.	57928	170508

Functional Area	Fix	Work Item	Case ID
	On the **Daily Planning** > **Shift Log** tab, the caption on the right click menu option in the grid has been changed so that **Delete Workorder** becomes **Delink Work Order**.	29427	
	On the **Daily Planning** > **Planning** tab, the **Deferred** status has been removed from the **Status** filter list.	51816	165354
	Users are now prompted if a work order has been changed by another user, if the work order was linked to a settlement.	52584	166470
	Fixed an issue where the **Authorisation** buttons were hidden on the **Workorder Editor** screen.	55499	168047
	Fixed a problem where employee information was not being saved on the **Shift Log** tab in **Daily Planning**.	55562	167969
	Fixed an issue where dragging a workorder on top of another was causing a runtime error in the **Scheduling** tab in **Daily Planning**.	56198	168584
	Fixed an issue where dragging a work order on top of an event was throwing an **Index was outside the bounds of the array** error in the **Scheduling** tab in Daily Planning.	57178	169478
	Fixed an unhandled error when creating **Rebuild Work Order**.	57762	170336
	Fixed an issue where **Downtime Variance Cause** is not saved when the user creates a new **Event** in the **Shift Log** in **Daily Planning**.	57951	167967
	Fixed a display issue with missing Tab Titles in **Daily Planning** when the primary monitor screen scale is set to 150%.	58194	170723
	Fixed an issue where **Planned** and **Actual Date/Time** were not visible on **Work Order Editor**.	59146	171477
	Fix to ensure that the **Stock Code** field is populated in the **Parts** grid in **Work Order Editor** when adding parts from the **Parts** table.	59687	171817

Functional Area	Fix	Work Item	Case ID
Web			
	Fixed a bug that caused the disappearance of the **Link Document** button in the of **Work Order Editor Planning** tab.	59871	172296
	Fixed an issue where **Part Unit Price** and **Total** values were displayed in the **Work Scope** report if **Dealer Financial Mode** was enabled.	59903	172335
	Added a dialog to prompt a user to check the ERP to validate if a work order and parts were created, when AMT detects a previous attempt to create the work order or parts, they will receive a system error. The prompt provides the user with two options. 1. Indicate the work order and parts are in the ERP, in which case AMT will only add the work order to AMT and indicate the PO for the parts that were created. 2. Indicate the work order and parts are not in AMT, and AMT will resend the work order and parts create request to the ERP.	60006	172223
	Fixed an issue where sometimes an abandoned work order still has a work order number and shows as <Due>.	60498	172723
	Fixed an exception when Create ERP WO is in PO mode.	61391	
	Fixed an issue where the **Create ER PWO** button is grayed out after a failure in creation process.	61496	
	Improved the performance of **Print Request for Quote** and **Print PO/Requisition** from **Work Order Editor**.	57326	168767
	When adding parts from the **Clipboard**, the part descriptions are now saved correctly.	60741	172801
	Financial detail (Unit Price, Total, Rate and so on) are **NOT** hidden when switching Strategy Columns using the **Hide/Show Strategy** button in **Parts, Labour and Misc** grids, if **Dealer Customer Financial Mode** is enabled	58016	170577
	Fixed an issue where AMT occasionally did not move deferred work orders into backlogs.	60973	173155 172497

Functional Area	Fix	Work Item
Checklist Management	Fixed an issue with the **Clear Filter** message being displayed incorrectly when checklist is selected twice.	54100, 54065
	Fixed a performance issue when there are large numbers of checklists by introducing pagination.	53088
	Fixed an issue with a question still being displayed as custom after the custom question has been deleted from question management.	56931
	Message to user confirming deletion of a checklist now includes the name of the deleted checklist.	57227
	Checklists can no longer be approved with no questions or empty sections.	57267
	Fixed navigation issues.	57304, 57305, 57306, 56528, 56529, 56665
	Fixed text box properties so that negative numbers are not allowed for length.	57495
	The **Check Box** question no longer displays a blank option.	57500
	Users are now able to select previous versions of a checklist without affecting the filters.	57501
	Fixed an issue with managing deleted checklist versions.	57854
	When a user creates or copies a checklist and filters have been set, the checklist is now displayed.	57864
	Fixed an issue where a recently viewed checklist, after checklist has been deleted, was still showing the checklist as available.	56668
	Fixed an issue with not being able to delete an empty folder in question management.	56724
	There is no longer a blank screen after the first question is created.	56725

Functional Area	Fix	Work Item
Checklist Management	There is no longer a blank screen when clicking on a folder from the Home screen.	56726
	Fixed an issue with **Question Management** missing some translation strings.	57190
	Enhanced the security of the checklist application to prevent unauthorised users from accessing it.	59119
	A **Deleted checklist** confirmation message now contains the name of the deleted checklist	57227
	Fixed an issue where the Checklist creation was randomly closing browser.	59340
	Fixed an issue with the **Delete** button showing incorrectly for Approved checklists.	61490
	Fixed various styling issues.	59702, 59873, 60536, 60617, 60538, 61492, 61495
	Fixed an issue with the **Discard** button not being displayed when a user has edited an approved checklist.	59853
	Fixed a filtering issue where tags at different levels would not filter correctly.	59963
	Fixed an issue where the status of the versions of the checklist template could be in an incorrect order.	60315
	Fixed an issue with the message **Something went wrong** displaying frequently when creating checklists.	58674
	Fixed an issue with the **Measurement Codes** drop-down not showing new **Checklist Management Codes** when added to the database.	60542
	Fixed an issue with the **Quick Search** drop-down not showing checklists in alphabetical order.	60859

Functional Area	Fix	Work Item
Checklist Management	Fixed an issue with the **Question Preview** showing the **Allow Notes** field twice.	61226
	Fixed an issue where, when moving an **In Design** question to a new folder leaves the previous version in existing folder.	62357
Checklist Results	Fixed an issue with the **Checklist Result** not displaying the work order operation number.	56642
	Fixed the default filter dates to include **Beginning** and **End** of day.	57454
	Print Preview now shows the correct number of images.	57611
	Fixed an issue where, when using **Print Preview** in dark mode was not displaying the correct colors.	57855
	Fixed an issue with the checklist result tags not getting updated when new data is available.	57856
	When Expanding sections in Checklist Results, the screen no longer scrolls to the top.	58642
Notifications	Fixed an issue with incorrect asset names being displayed in a notification.	57295
	Notification filter dates now default to today to enable user to see notifications just created.	57301
	Symptom **Code** and **Description** now being saved when the Notification is updated.	57338
	The **Breakdown Indicator** is now showing correctly in the Notification listing.	57354
	The **Auto Create WO** indicator now shows correctly.	57358, 59368
	Fixed the refresh issue in the **Notification Detail** screen, where all data was lost from fields.	57362

Functional Area	Fix	Work Item
Notifications	Fixed an issue with **Date** filter showing incorrectly in the calendar with the calendar component upgrade.	57360, 57650
	The **Task Counter** in the **Work Order** panel now displays the correct value.	57364
	Fixed an issue where drop-down fields selecting the first entry without the user clicking on it.	57366
	Fixed **Date Raised** and **Required by Date** issues to now use current UTC date time rather than local server time.	57393, 57408
	The **Export** message is now read-only.	57406
	The **Date** display now shows the correct timezone.	57427
	Increased the length of input fields to match the database schema.	57443
	Fixed the notification **Attachments** functions.	57456, 59192
	Fixed the format of the warning message when creating a new notification.	57504
	Users can now clear a drop-down selection and save the notification.	57507
	Fixed the label for the **Repair Instructions** field.	57602
	Updated **Asset** field label to display **Equipment**.	57606
	Fixed the error that displays when filtering by **Status** or **Priority**.	57507
	Fixed an issue with the **Date** picker accepting dates in the wrong format.	57953
	Fixed the **Calendar** to not allow dates in the past to be selected when creating a notification.	58377
	Fixed issues with the security of various functions in **Notifications**.	58919, 59021
	The **Create Notification** button now displays correctly.	59157
	The Notification display now shows correct field values after saving.	59194

Functional Area	Fix	Work Item
Notifications	The **Create Notification** button now displays correctly.	59157
	Fixed an issue where the **Notification** display was not showing correct field values after saving.	59157
	Fixed navigation issues for multiple view and edit detail screens	59243

Functional Area	Fix	Work Item
Notifications	The **Ok** and **Cancel** buttons no longer float.	59369
	Fixed the order of processing for multi-selected notifications where it was different to the order being displayed.	59441
	There is no longer an error when creating and editing **Notifications**.	57546, 61119
	Fixed the issue where creating a new **Work Order** from a **Notification** failed to inherit the attributes of the Notification.	58387
	Fixed various styling issues.	58389, 58391, 60015, 60093, 60094, 60095, 60098, 58556, 60122, 62451, 61225
	Fixed confusing navigation behaviour when creating **Notifications**.	57671
	Fixed an issue where **Select All** on the grid was only working on the first page.	59545
	Fixed an issue where the **Equipment** number was not being displayed in the **Notification** creation process.	59733
	Fixed an issue with **Breakdown** showing with incorrect Boolean value.	60196
	Fixed an issue with the **Task Counter** not displaying the correct value.	60304
	Fixed issue with the **Work Order** link failing to navigate after the security token expires.	60323
	Fixed an issue where **Attachments** that were uploaded via an old Notification were not being able to be downloaded from the new Notification app.	60328
	Fixed grid sorting issues.	60365

Functional Area	Fix	Work Item
Integration Status	Fixed various filtering issues.	61200
Common	Fixed various issues relating to translation files.	52309, 58630, 60955
	Fixed missing general error provider to ensure all errors are captured and displayed correctly to the user.	57186
	Fixed the error message being displayed at first login.	57429, 59535
	Fixed **Date**,**Time** and **Number** formatting for different locales.	58378
	Fixed Rail menu styling issues.	57309
	Fixed an issue with the **About** box not showing service versions.	61581

AMT 8.24.1

The following is a list of all changes and updates addressed in AMT 8.24.1.

Enhancements

Azure Active Directory configuration

AMT 8.24 introduced capability for AM to authenticate against Azure Active Directory (AAD).

Previously, the configuration for AAD was preset within AMT. This update provides extra functionality to configure how AMT authenticates with AAD.

New settings in AMT_TYPED_VARIABLE allow a customer to configure the Tenant ID, and other settings used with AAD.

The new settings are:

- AmtCloudAzureTenantId
- AmtCloudAzureApiScope
- AmtCloudAzureWindowsClientId
- AmtCloudAzureInstanceUri
- AmtCloudAzureWindowsRedirectUri

Fixes

Functional Area	Fix	Work Item	Case ID
Budgets	Fixed an issue where if different costs were linked to strategy task occurrences, costs in budget could be incorrect, or an error could be raised when adding equipment to the budget. Only applicable if **Long Wall Mining** (Feature 32) is enabled.	56379	
	Fixed and issue where the **Expense Element** filter was not applied for Unassigned tasks, LDST tasks and FFDST tasks when equipment was added to a budget.	52211	166334
	Improved performance when adding equipment to the budget.	58942, 58886	
CBM	Fixed an issue where an email for measurement was not sent when matching CBM condition monitoring interpretation rules were configured to send emails.	59342	171714
Data Models	Fixed an issue in BudgetVsActualDataModel where ActualUsage calculates PeriodUsage incorrectly.	58335	170445
	Performance improvements made to UniversalLoggingDataModel.AuditLogEvent.	59431	171830
Equipment	Fixed an issue where, when adding a new projection to an Equipment, an **Invalid column name 'Task_Id'** error was displayed.	59483	
	Fixed an issue where, when deleting a strategy task from equipment an **Invalid column name 'Task_Id'** error was displayed.	58349	170848
	Fixed a divide by zero error when updating **Start Date** and **Commissioning Date** for Other Operating Cost Strategy Task.	52552	166578
	Fixed an issue where **Equipment Administration** was throwing an exception when the number of Tech Fields exceeds 100.	58664	170827

Functional Area	Fix	Work Item	Case ID
Events	Fixed an unhandled exception when merging events in the **Daily Planning** > **Events** tab.	60305	
Generic Logging	Fixed an issue for the **Audit Log** and **Audit Log Report** where an exception was thrown for the date and time.	56079	167611
	Performance improvements for **Audit Log** and **AMT Audit Log Report**.	59890	
	Fixed an issue where changes to **Budget Header** records were not created in the **Audit Log**.	59098	
	Fixed an issue where the **Audit Log Report** was not displaying all changes within a date range.	60180	170783
IC Data Import	Fixed an issue with **IC data import** failing with the message **IC_IMPORT_P expects parameter @ImportDirectory** which was not supplied.	60409	171837
Integration	Added support for AMT EPF Adapter version 2.2.6.	58876	
	Fixed a casting error when using the **ImportActualCost** function of the classic Overhead web service.	60757	
	Fixed a null reference issue when using classic file drop to import usage profiles.	60651	
	Fixed an issue for casting an object when using the **ImportWorkorders** function of classic Work Order web services.	60685	
Library	Fixed an issue where the **Library** function would not launch.	59901	
Long-term Planning	Fixed an issue where the **Forecast Worksheet** report returned no data when filtering by **StrategytaskDesc**.	56865	166784
	Fixed an issue where **DLCC** sometimes calculates an incorrect first occurrence in sibling suppression group.	53994	167049
	Fixed an issue in the **Long-term Planning Log** report where values for **Current Next Due** were missing.	59296	171269

Functional Area	Fix	Work Item	Case ID
Long-term Planning Advanced	Fixed an unhandled exception when setting **Next Scheduled Date** in **Long-term Planning Advanced**.	58869	
	Fixed an issue where the **Long-term Planning Advanced** screen was throwing an error on applying filters.	54111, 55387	167277, 167954
	Fixed an issue where the Long-term Planning Advanced screen was throwing an error when assigning an STO.	55389	167954
Notifications	Fixed an issue in **AMT Web** where the **Notification** app was displaying the incorrect job code.	59490	

Functional Area	Fix	Work Item	Case ID
DLCC	Fixed an issue with centerline equipment costs and usage did not reset at the beginning of each month.	53345	169171
	Fixed an issue where the system task **Update Planning From Strategy** would not run.	59633	
	Fixed an issue to make sure **Next Occurrence** is calculated correctly in sibling suppression group.	52640	166828
	Fixed an issue where **DLCC** sometimes does not calculate all tasks in the scheduling group.	52360	166379
	Fixed an issue where the system task **Update Planning From Strategy** reported an exception **Cannot insert the values Null into column. RequiresSTO**.	57483	
	Fixed an issue where **DLCC** is sometimes locked by a process which checks if a projection requires calculations.	54736	167226
	Fixed an issue where **DLCC** somemtimes does not calculate projections manually when set to recalculate in **Recalc Manager**.	59869	
	Fixed an issue where DLCC was constantly re-creating accrual settlements.	54281	167435
	Made performance improvements to DLCC settlement merging.	59134	171413
	Fixed an issue where the system task **Update Planning From Strategy** reported the exception **Cannot insert the values Null into column PlanStatus**.	59999	
Reporting	Fixed an issue where **What-If Life Cycle Analysis**, **PCV Chart**, **High Risk**, **High Opportunity** and **Change Out Analysis** reports are slow to open.	56922	
	Fixed an issue in the **Parts Warrant** report where duplicate line items were appearing.	60745	171750
	Fixed an issue where new data was not loaded into the **IC database** for the **Maintenance Compliance** report.	60290	172311

Functional Area	Fix	Work Item	Case ID
Strategy Tasks	Fixed an issue where text was getting truncated during the creation of strategy tasks from standard jobs.	57461	168771
	Improved the performance of **Strategy Task Manager**.	58931	
	The **Projection Summary** report now loads without error when **Cost Bearer** is selected, and the report is viewed.	60473	172678
	Fixed issue that causes the **Risk Rating** calculation to not be updated when updating **Operational Criticality** from the **Multi-Task Editor**.	60781	172399
	Fixed an issue where, when copying strategy tasks, a timeout and deadlock occurred.	59722	170194
System	Corrected missing translation for **Budget and Forecast Manager**, **Functional Location Manger** and **Quick Watch**.	56946	
	Fixed an issue where an error occurred when saving changes to Sub-Systems in the **System Administration** editor.	59090	171393
Technical	Fixed **Change Data Capture (CDC)** errors on upgrading AMT to 8.24 U1.	59703	
	Added a meaningful exception reporting for when **CDC** is not configured correctly.	56302	
	Various performance improvements related to database connections and memory management.	53375	
Users	Fixed an issue where terminated users could still log in.	57010	169342
Work Orders	Fixed an issue where bulk printing of work orders would not find all matching work orders.	59012	170999
	Fixed an issue where STO could not be saved in **Work Order Editor**.	57929	170508
	Fixed an issue where the authorisation buttons were missing from the **Work Order** screen.	57929	170508

Functional Area	Fix	Work Item	Case ID
Work Orders	Fix an issue when adding parts from the AMT parts table to operation parts with AMT configured to show the Parts **Stock Code** field. The **Stock Code** field is now correctly populating with the **Manufacturer Part Number** from AMT Parts Manager.	60647	171817
	Fixed an issue that is causing the disappearance of the **Linked Document** button in the **Planning** tab on the **Planning** window.	6019	172296

AMT 8.24

The following is a list of all changes and updates addressed in AMT Version 8.24.

New Features

Paste parts list into Work Orders

New functionality has been added to enable users to paste a list of parts from Excel into an AMT work order in order to improve the efficiency of planners. This functionality is useful for scenarios where external contractors provide a parts list for a job and the list needs to be copied into AMT to plan the work order.

Work Orders

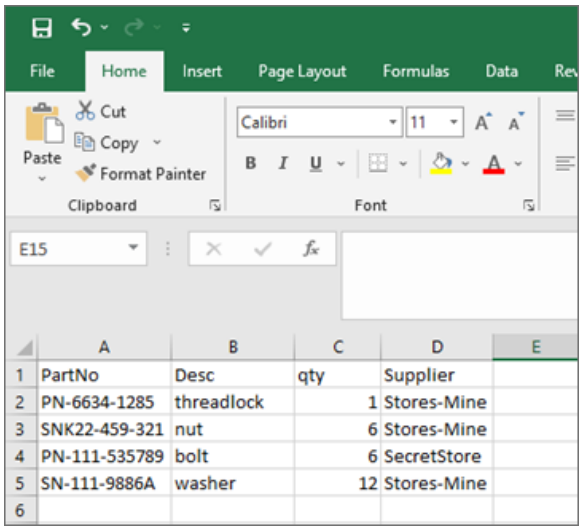

Edit Work Order

When editing parts in the Work Order Editor, an option to **Add Parts - From Clipboard** has been added to the **Edit** drop-down menu. This functionality allows a list of parts to be copied to the clipboard from Excel, and the clipboard is displayed as a grid in AMT. The grid lets users identify the type of AMT field in each column. The following fields are supported in the new functionality:

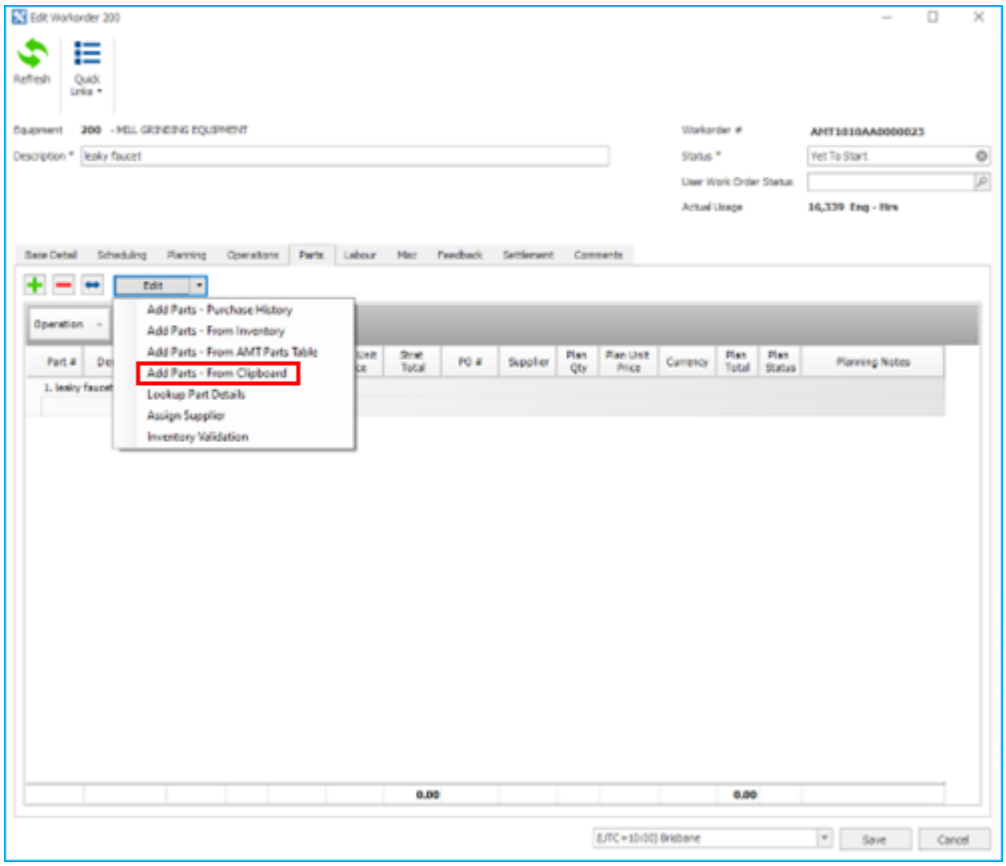

- Part Number
- Part Description
- Source of Supply
- Stock Code
- Supplier
- Planned Quantity
- Planning Notes

Not all fields need to be included in the data copied to the clipboard. The minimum fields required for the functionality to work are **Planned Quantity**, with either **Part Number** or **Part Description**.

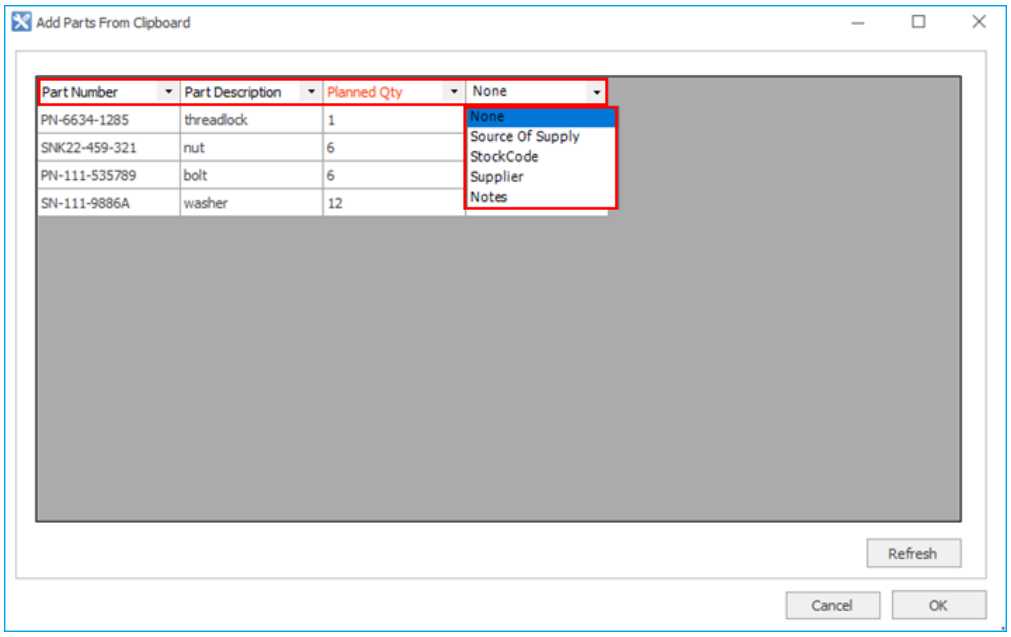

Below is an example dataset in a spreadsheet.

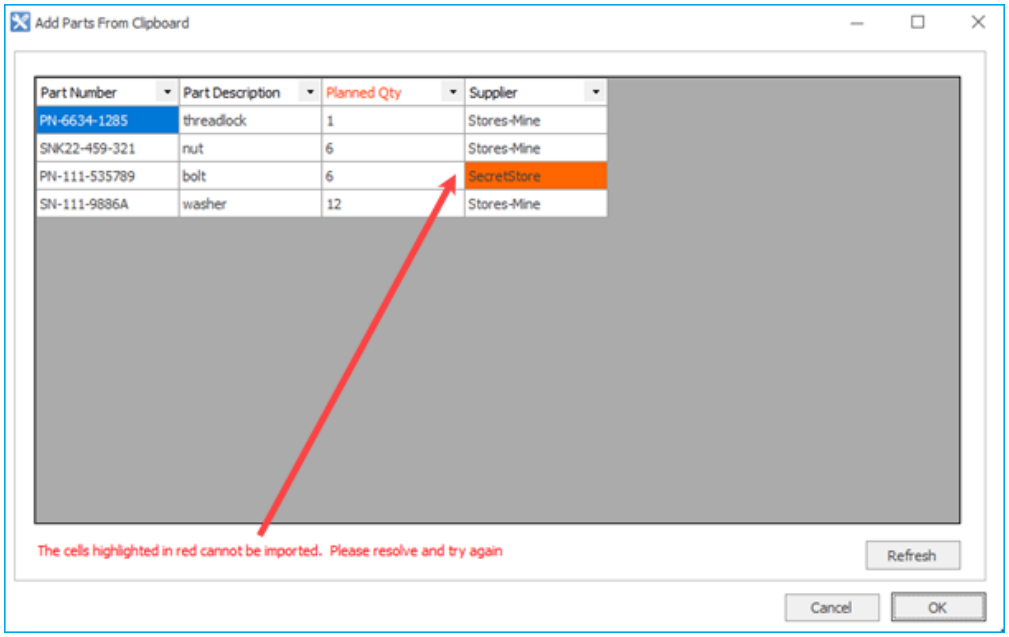

With the data copied to the clipboard, the **Work Order Editor** can be used to select the operation the parts will be added to. **Click Edit** > **Add Parts - From Clipboard**.

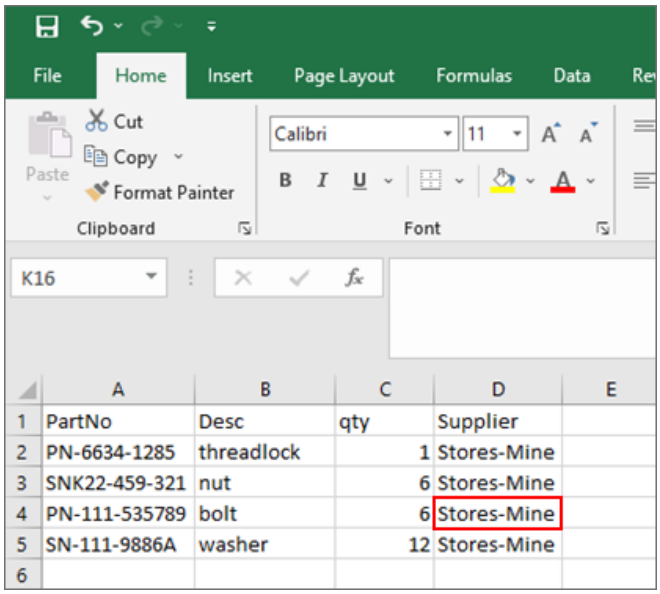

A grid displays with the contents of the clipboard. Use the drop-down menus at the top of each column to specify the AMT data for the columns. When the columns are set with the AMT fields, click **OK** to validate the data.

The data in the grid is read only. The column headings can be modified if data was accidentally mapped to the wrong column. If there are validation errors in the data from the clipboard, the cells in error are highlighted.

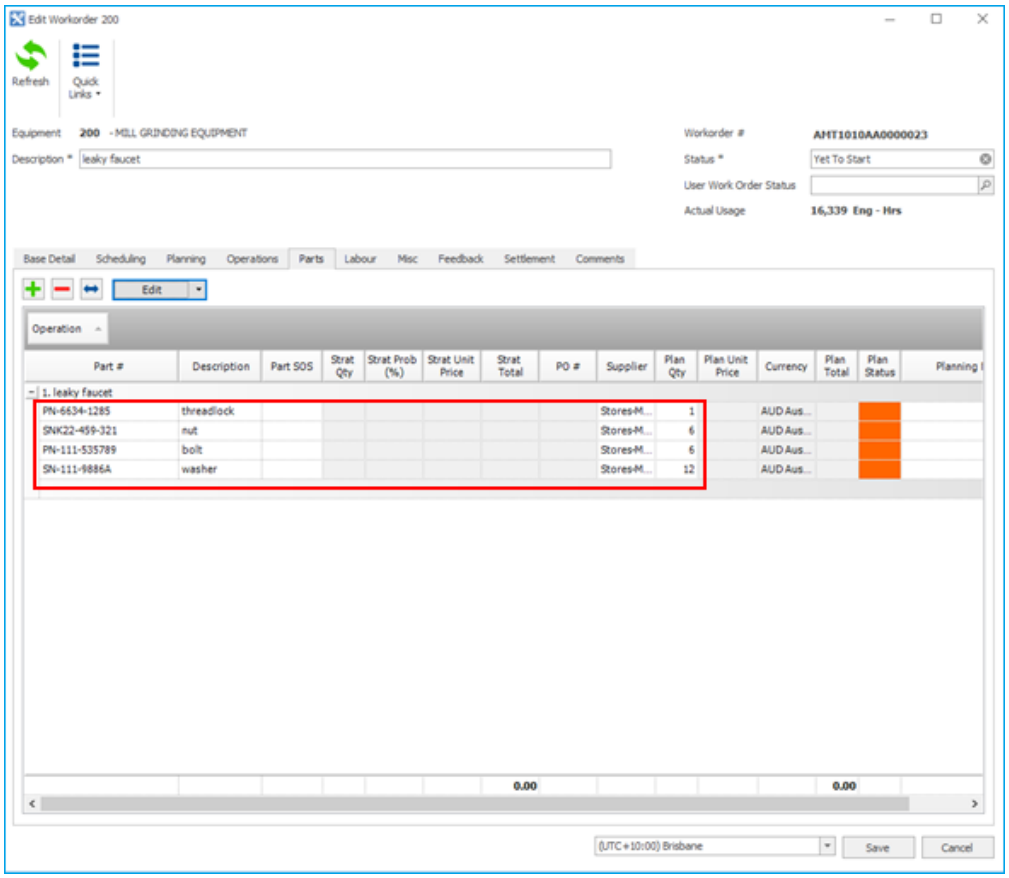

The data will need to be fixed in the data source and copied to the clipboard again.

Click **Refresh** to reload the corrected data from the clipboard into the grid, then click **OK** to validate the refreshed data.

Once the parts data passes validation, it is appended to the work order parts grid as new parts. The functionality does not try to match existing parts and update them.

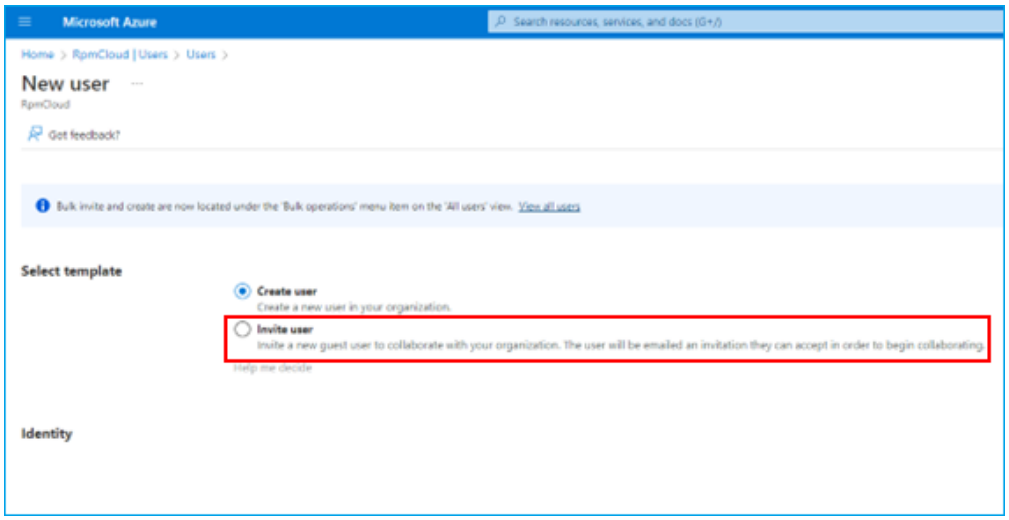

Standard AMT functionality can now be used to save the work order, validate the parts against inventory, assign a supplier, and so on.

The functionality operates on one operation at a time. If parts need to be added to different operations, the **Add Parts - From Clipboard** process needs to be repeated with the parts list for each required operation.

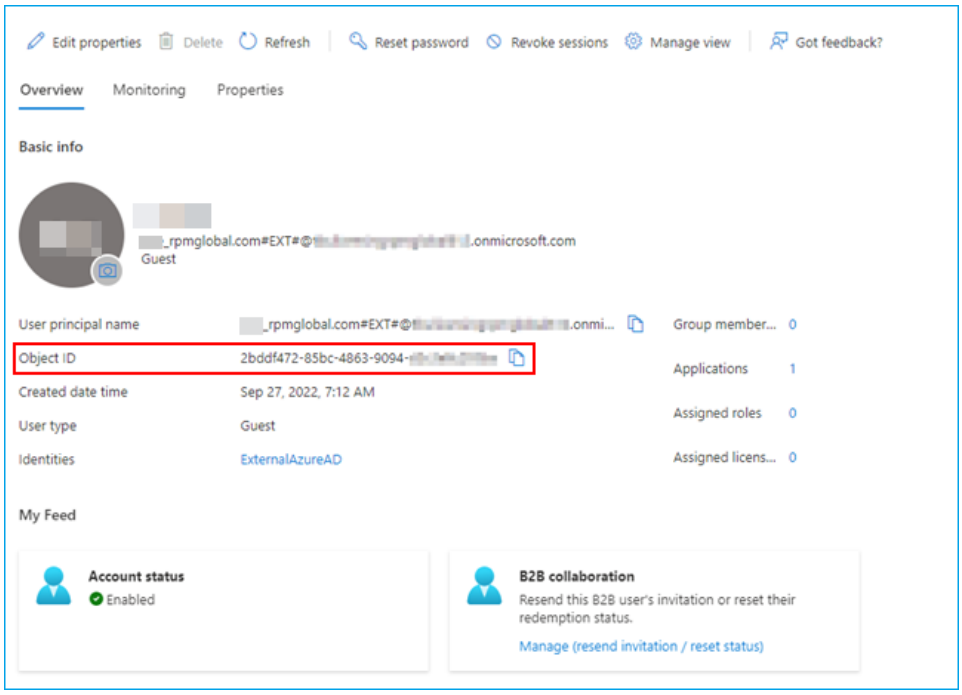

Azure Active Directory authentication

New capability has been added to AMT to authenticate using the **Azure Active Directory (AAD)**. Customers can be invited to the RPMGobal Azure Active Directory and use this to authenticate log in to AMT.

This feature requires the setting **AMTAdvancedAuthentication** in **AMT_TYPED_VARIABLE** to be set to **2**.

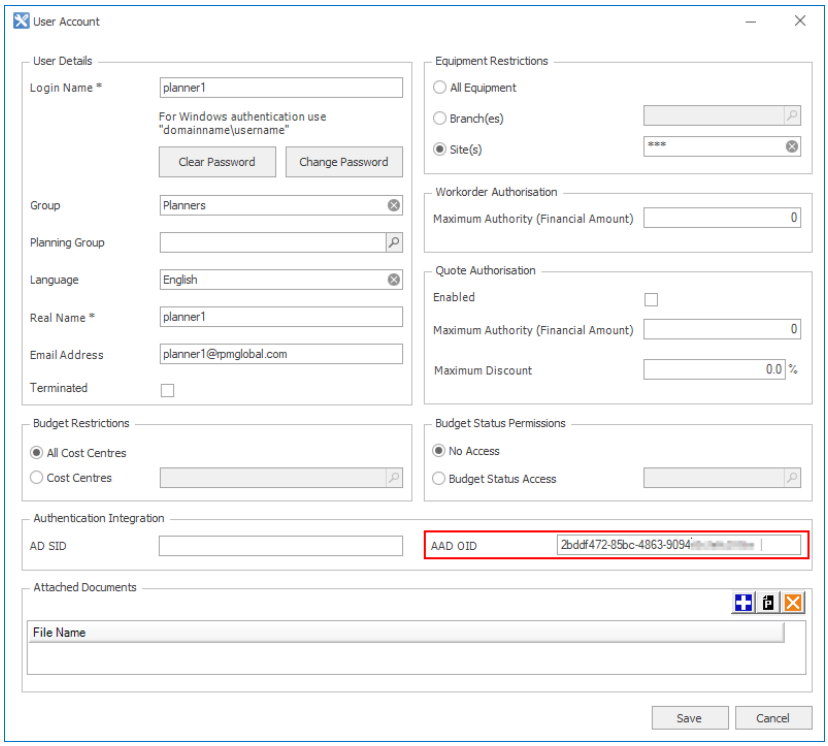

With the feature enabled, when logging in to AMT an Azure Active Directory Login screen is displayed. Authentication will be performed against the RPMGlobal AAD. If the credentials are valid, the authentication process receives an Object ID from AAD which is used to find the AMT user setup with the matching AAD Object ID.

If there is no matching user, or the credentials are invalid, the user will not be logged in to AMT.

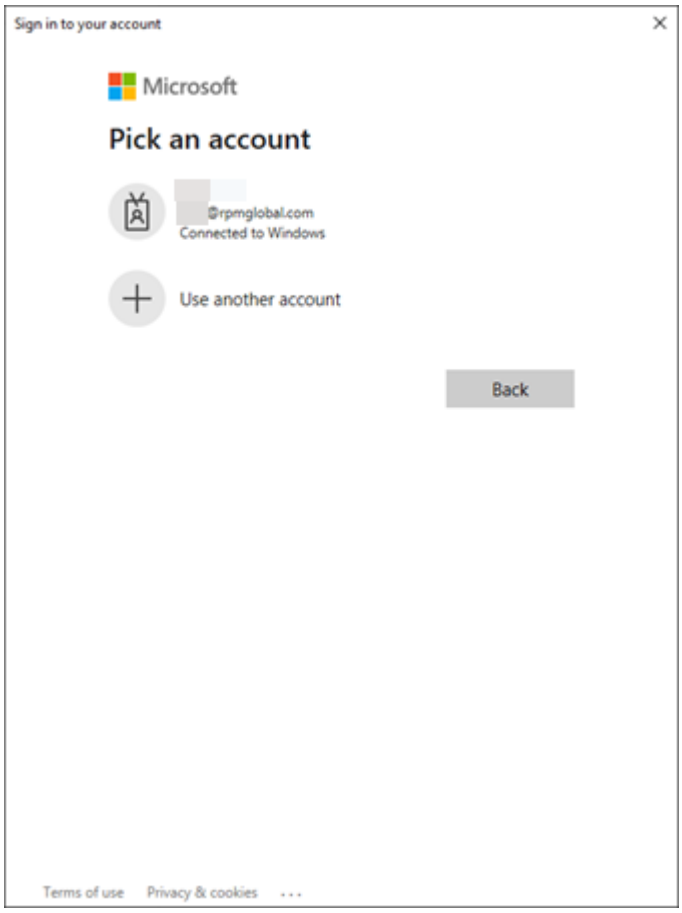

Edit user account

The user account detail form has been enhanced to add the Object ID of the user from the AAD. Each user set up in AAD will need the Object ID saved into the AMT user account.

Login screen

A new sign-in screen displays if Azure Active Directory authentication is enabled.

Event merging

AMT now supports retaining manually entered planned downtime allocations and actual downtime allocations when merging planned AMT events and external events from the AMT EPF Asset Statistic Adapter. This is intended to support the following scenarios.

1. Planners create planned downtime allocations in planned events as part of the planning process. When work on the equipment commences, an external downtime notification is sent to AMT from the external downtime management system. The AMT user links the planned event to the imported event from the external downtime management system. Previously, the planned downtime allocation from the planning process was lost, and replaced with the downtime allocation from the external downtime system. Now, the planned downtime allocations will be retained in the merge process so the user can see the planned downtime from the planning process, and the actual downtime from the external system.
2. An equipment breakdown results in the downtime management system creating a downtime event in AMT. At this time, the downtime event does not contain any downtime allocations. The planner decides to

include an already planned PM service into the event. The PM service work order already existed in AMT with a YTS Event with planning downtime allocations. When merging the planned PM event with the external downtime event, the planned downtime allocations should be retained. The status of the external event (IP) will not change, but the event type (breakdown) would be taken from the AMT planned event.

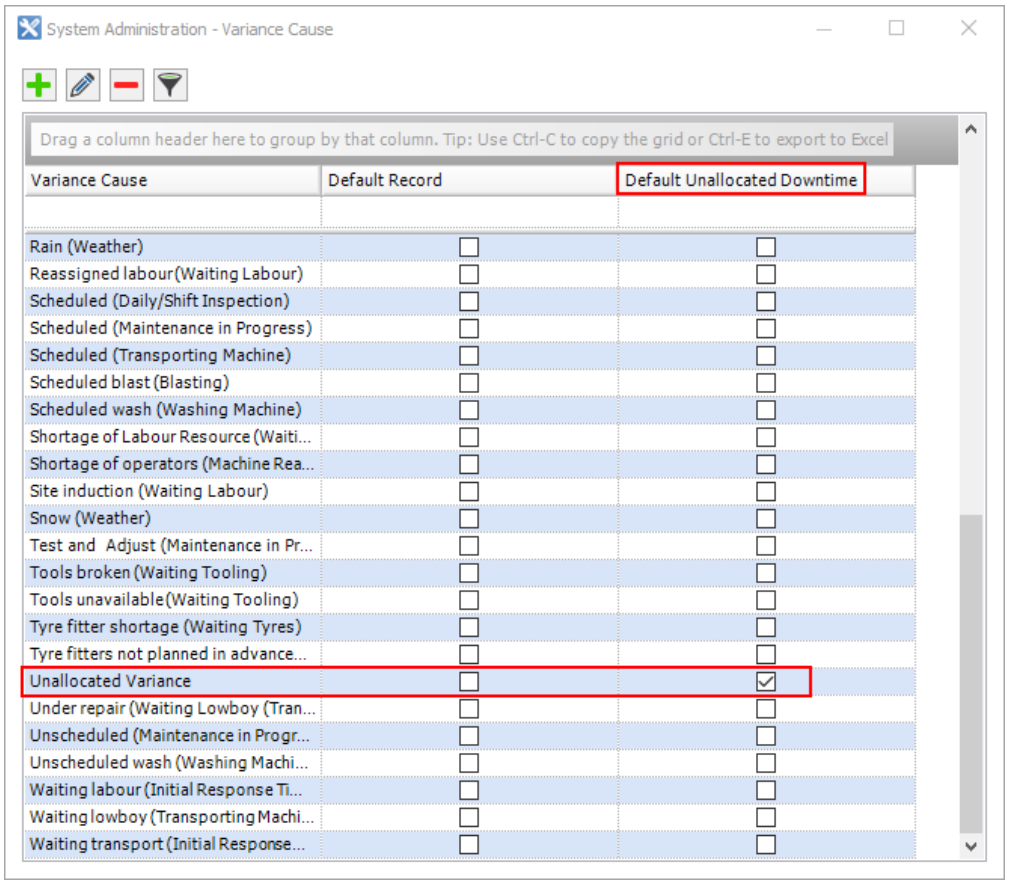

3. Users may add new downtime allocations to an in-progress event which contains actual downtime hours. The new downtime allocations added will not be deleted when the external downtime management system updates the AMT event.

In the situation where actual downtime entered by the user is greater than the actual downtime from the external downtime management system, AMT will create a new (non-primary) downtime allocation with a negative value to balance the downtime allocations in AMT with external downtime. The automatic downtime allocation will use the Variance Cause defined as the Default Unallocated Downtime.

Selecting one of the Variance Causes as the Default Unallocated Downtime is a pre-requisite for this enhancement to work.

System administration - Variance Cause

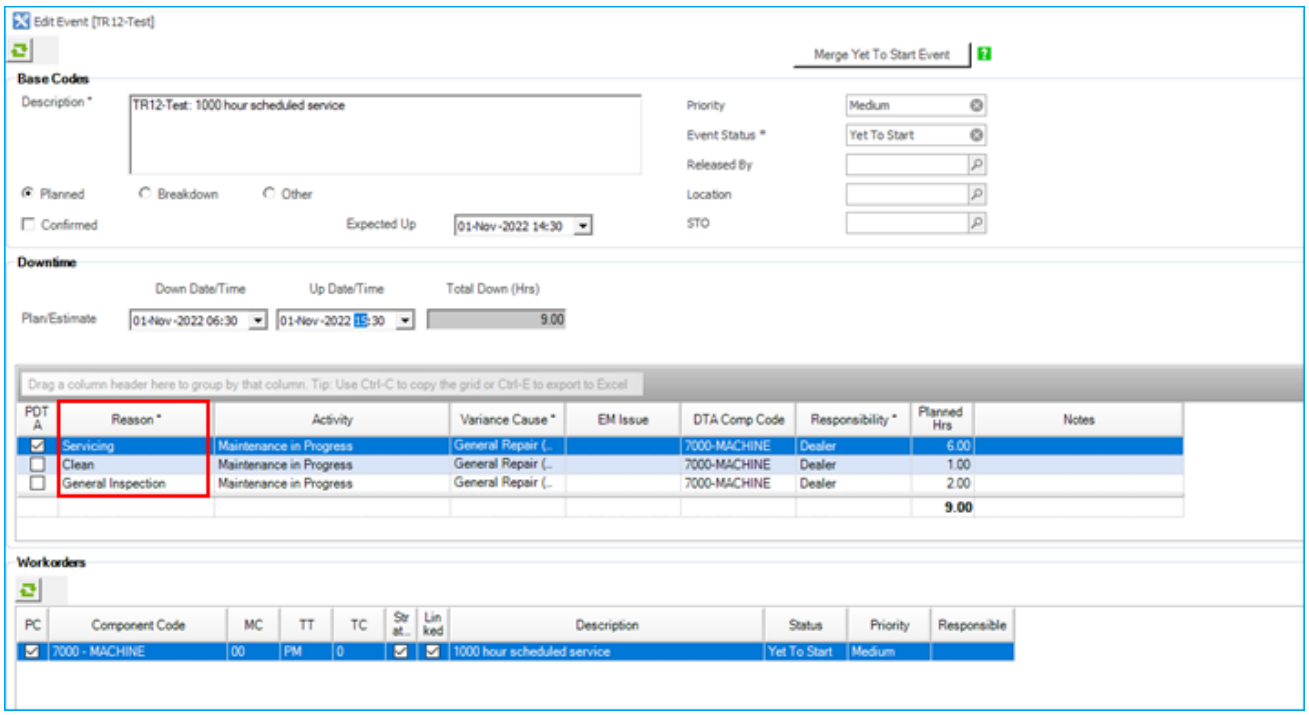

A new attribute has been added to define which **Variance Cause** should be used as the **Default Unallocated Downtime.**

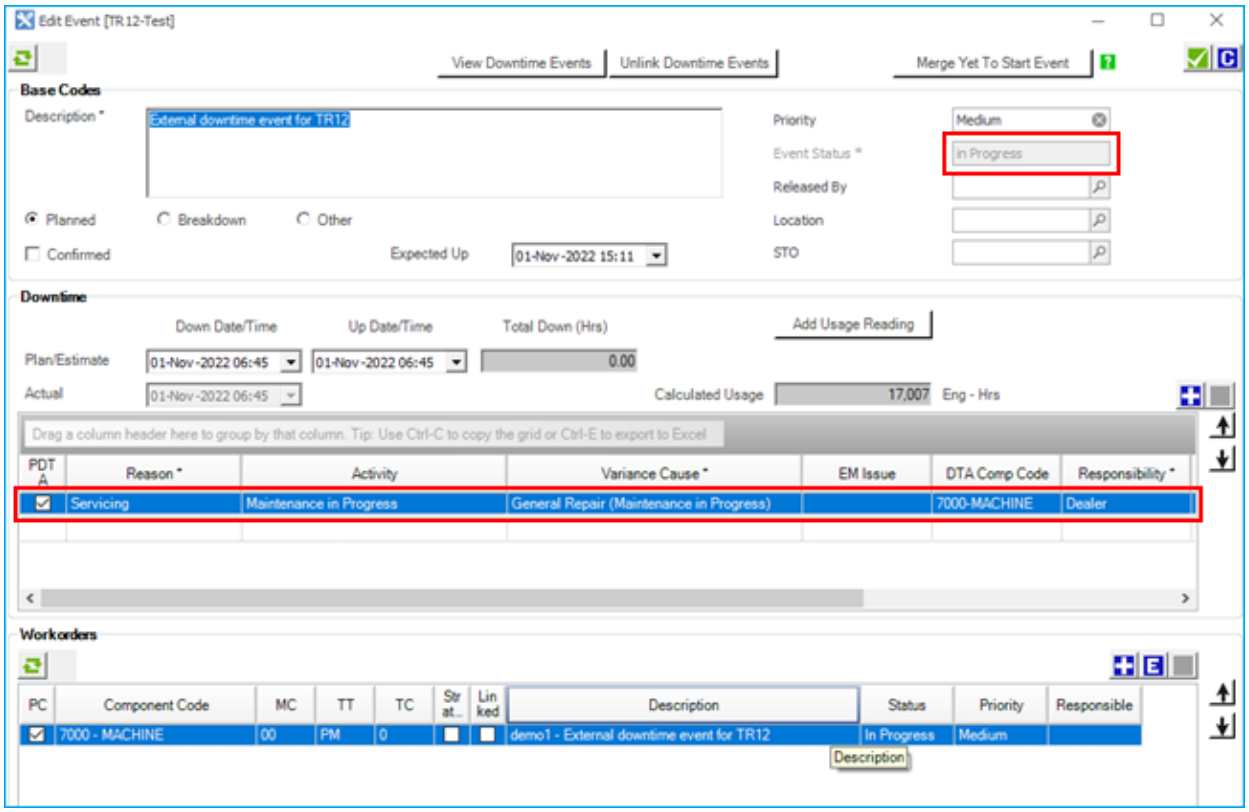

Edit event - merge Yet to Start event

When merging **Yet To Start** events with external events, if the Default Unallocated Downtime is defined in the Variance Codes, AMT will retain planned and actual downtown hours entered by the user.

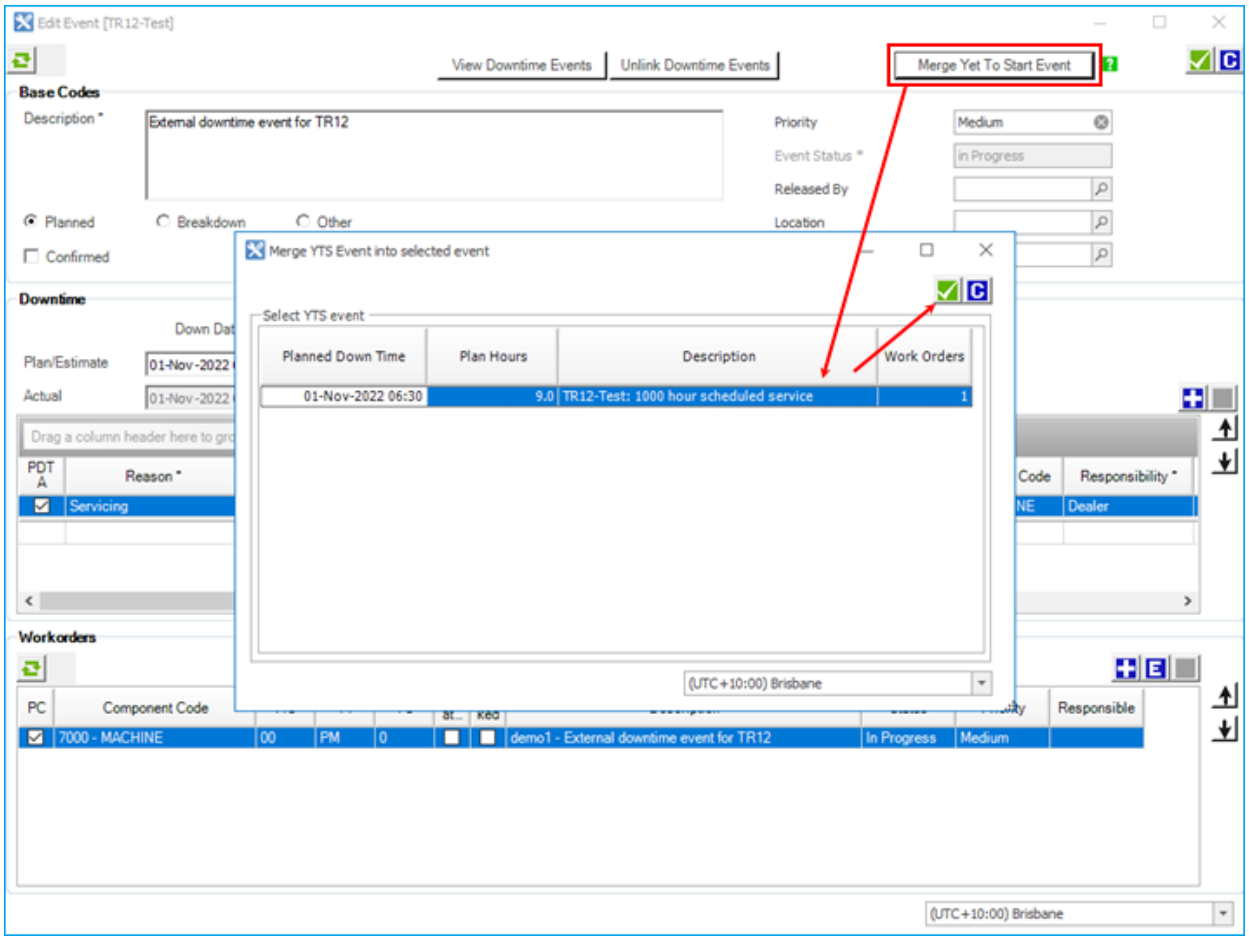

Below is a planned event in AMT, created by the Planner. Note the multiple downtime allocations planned to be performed in the event.

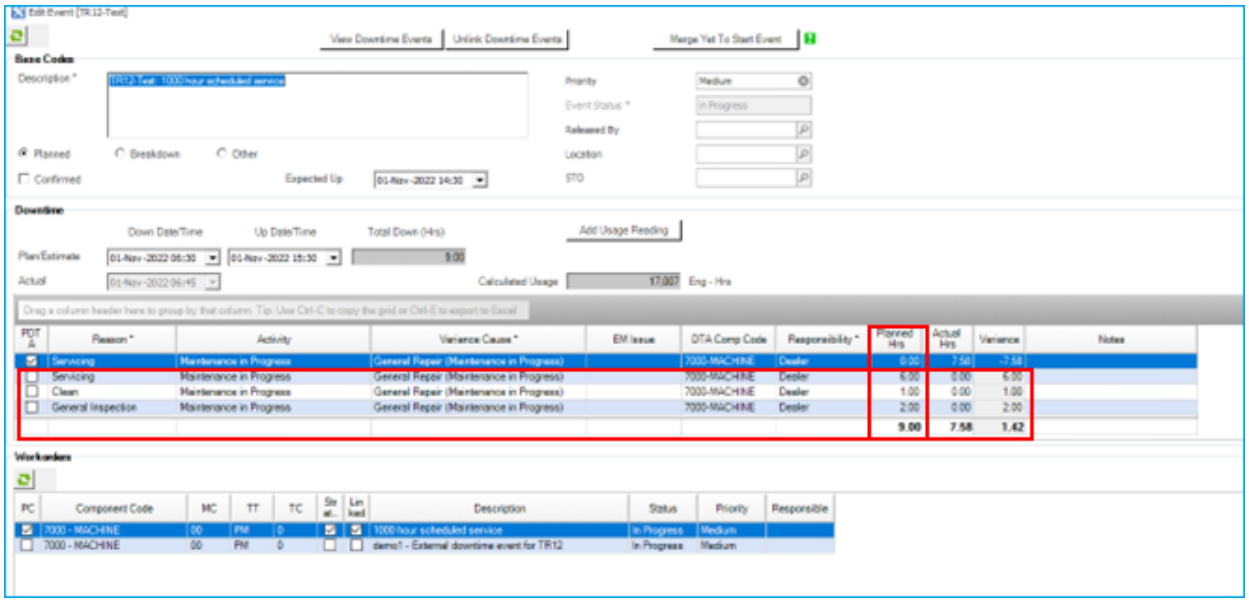

Below is the event raised by the external downtime management system when the machine was taken off production and maintenance started. Note that at this point the event is in progress and only has the downtime code provided from the external system.

Users and planners can merge the external downtime event with the event planned by the planners, and the planned downtime allocations and planned hours will be retained. Prior to this enhanced functionality, when merging the planned event and the external event, AMT would delete the downtime allocations planned by the planner.

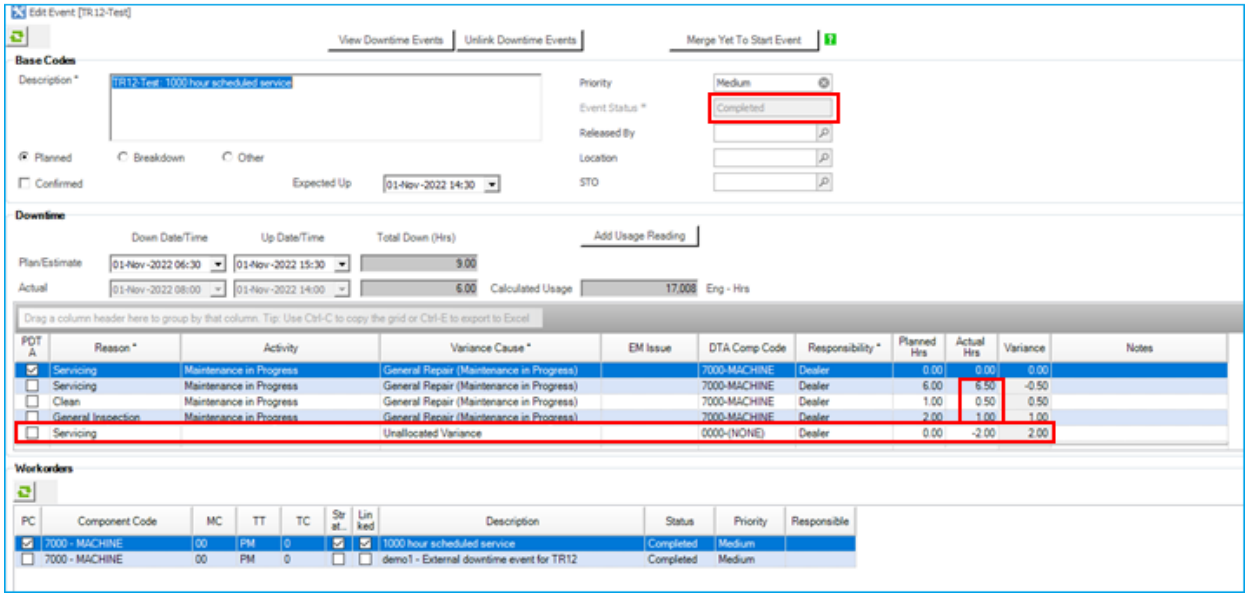

Below is the resulting event after the merge. Note that downtime allocations from the planned event are maintained in the merge process with the planned downtime allocations. If the combination of codes in the primary downtime allocation is identical between the external event and the planned event, when initially merging events, the planned primary downtime allocation is copied to maintain the values.

Next, the external downtime management system sends an update reporting the event is completed, but according to the downtime management system the event was completed in six hours. The screen below shows the event after the update.

Note that AMT has retained the actual hours entered by the team lead. AMT has also used the **Default Unallocated Downtime Variance Code** to automatically generate a balancing record to match the actual hours entered in AMT with the actual hours from the external downtime management system. This will allow planners to investigate discrepancies and correct as required.

Universal logging

A new feature to enable audit logging of data changes has been added to AMT, which works with a limited subset of AMT data.

The feature leverages standard SQL Server functionality for change data capture (CDC). A new AMT system task, **AMT Generic Logging**, runs every minute to process the CDC data into AMT history tables. Users can review the changes logged to the history tables using a new AMT Client function, **Audit Log**, or a new report **AMT Audit Log Report**.

The audit log feature allows users to see which user modified the AMT data, and when it was changed, along with the before and after details for the fields changed. Creation and deletion activities are also logged.

The new functionality requires SQL Server CDC to be enabled for the AMT database.

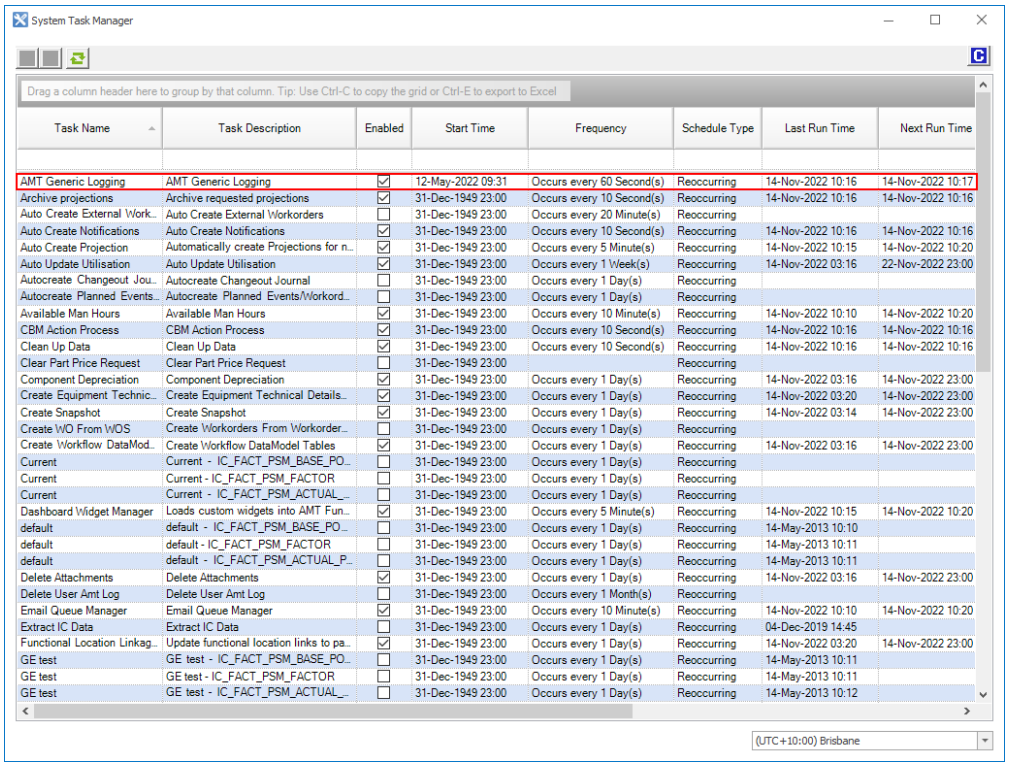

The following entities support audit logging with this release:

- Planning Work Orders (also called Tasks), including details for the header, operations, parts, labour, miscellaneous and attached document references.
- Event details, including the downtime allocations.
- Asset Condition Codes.
- Equipment Criticality Codes.
- Operation Criticality Codes.
- Risk Grouping Codes.

The default retention days for audit logging data is 90 days. Talk to your AMT Technical Consultant if this setting is required to be changed for particular AMT entries.

System Task Manager

A new system task has been added to AMT to process the SQL Server CDC logging data into AMT history tables for review and reporting.

Time zone support

AMT 8.24 introduces time zone support to several key functions. Using the time zone support, users are able to view and work with dates and times relative to their own time zone, or the time zone where the asset is physically located.

Time zone support AMT works by converting dates and times between two reference time zones:

- The time zone of the AMT user.
- The time zone of the site where the physical asset is located.

Given these two reference time zones, users have the choice of working with dates and times relative to their personal time zone, or the time zone of the asset.

Configuration required

A new AMT_TYPED_VARIABLE value, **SQLServerTimezonename** is required to be configured as part of the installation or upgrade of AMT 8.24. Consult the AMT M310 configuration documentation for details.

Reference time zones

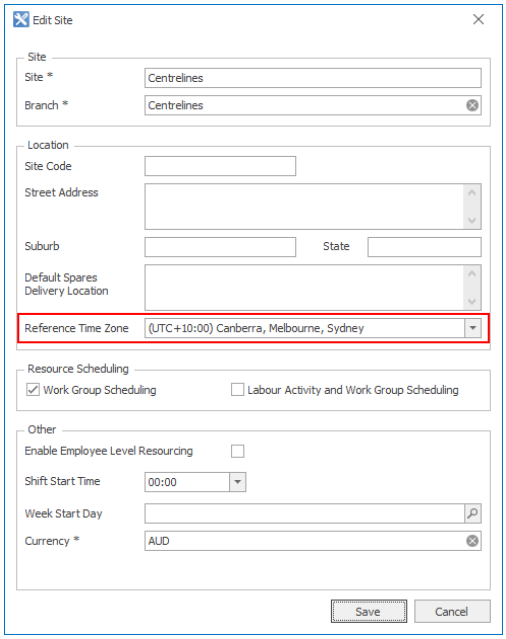

For the time zone feature to work, it is necessary to first specify the time zone of each AMT user and the time zone of each site in AMT.

User time zone

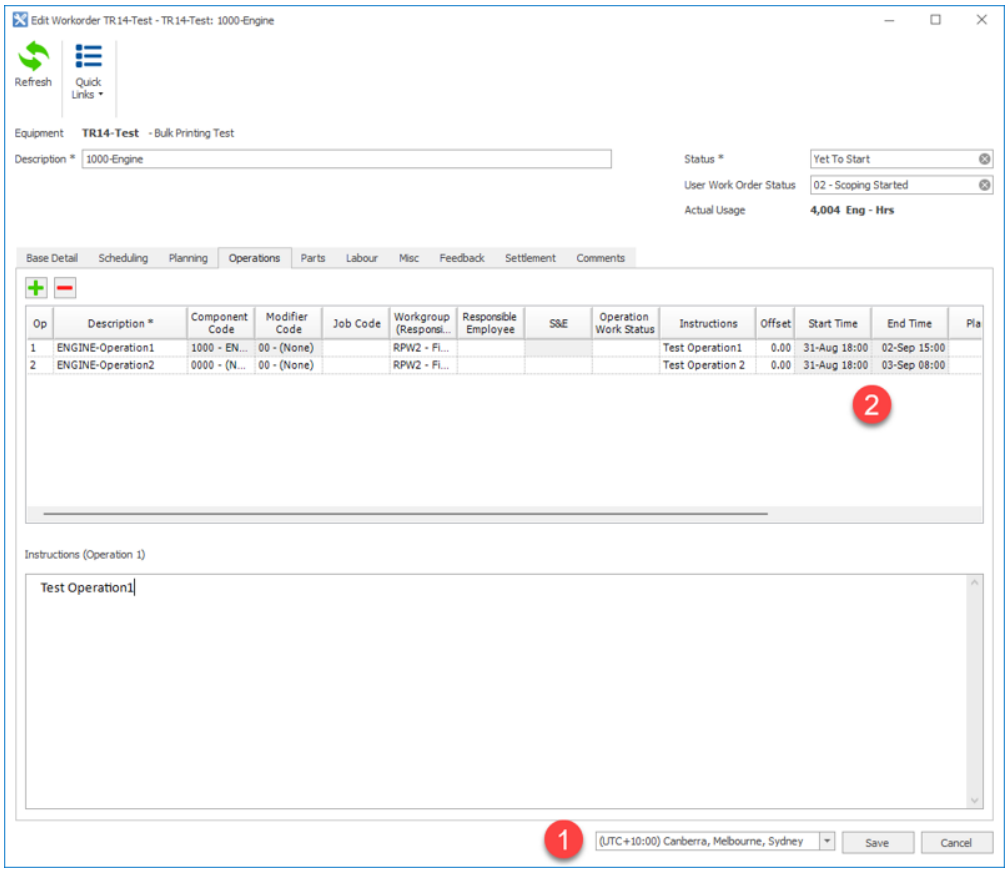

The time zone of an AMT user is controlled by the time zone of the computer the AMT client is installed on. This is automatic.

Site time zone

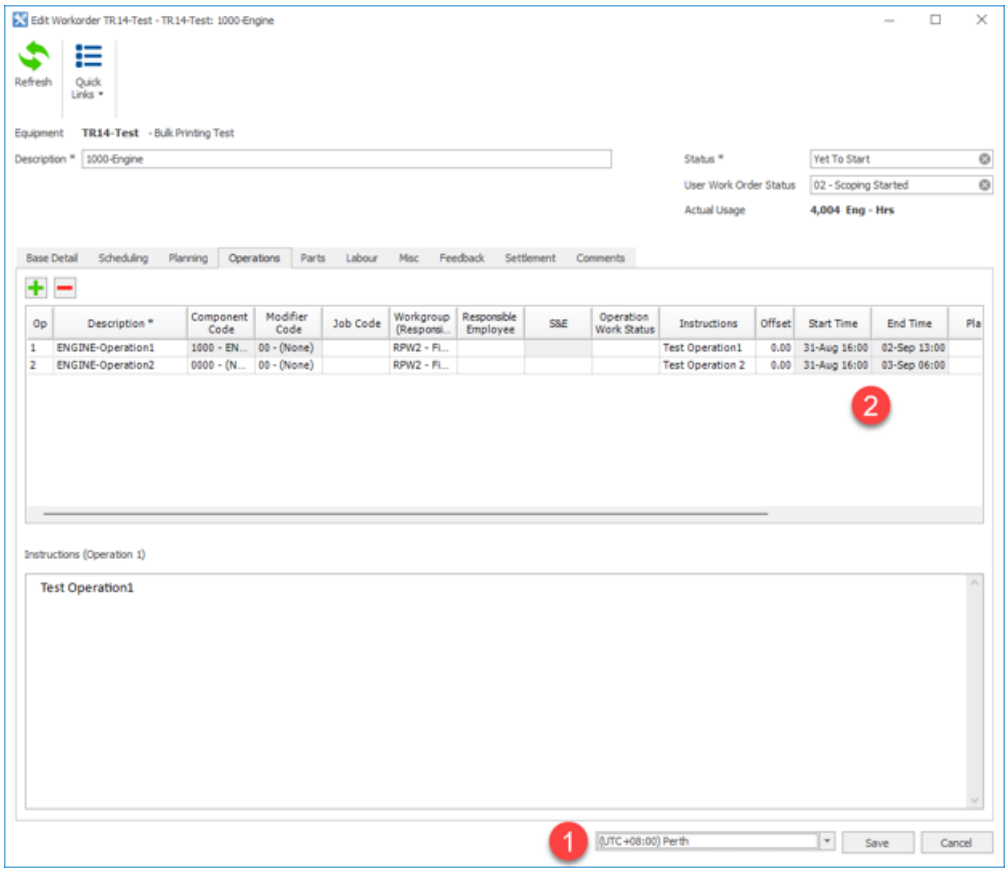

The site reference time zone needs to be specified for each site in AMT. This can be done via the **Edit Site** screen.

Once configured, AMT features where time zone support has been enabled display a control displaying the time zone the dates and times are relative to. For example, the image below shows the work order **Operations** tab in AMT 8.24. The user's time zone is shown in the drop-down list at the bottom of the form (**1**). The dates and times shown in the form (**2**) are relative to the user's time zone.

If the user chooses to, they may change the reference time zone by selecting a different time zone from the drop-down list (**1**). This will cause the dates and times to be updated to be relative to the newly selected time zone. For example, if the user changed the reference time zone to Perth (**1**), the times at (**2**) are recalculated to be relative to Perth, which is two hours behind Sydney (see the screenshot below).

Features affected

Time zone functionality has been exposed in the following features in AMT 8.24:

- Actual Usage Editor
- Budget System Task Status
- Daily Planning > Equipment Down tab
- Daily Planning > Events tab
- Daily Planning > Scheduling tab
- Daily Planning > Shift Log tab
- Event Editor
- Measurement Editor
- Merge YTS Event
- STO Editor
- STO Manager

- System Task Status
- Work Order Editor

Feature preview

System data localisation

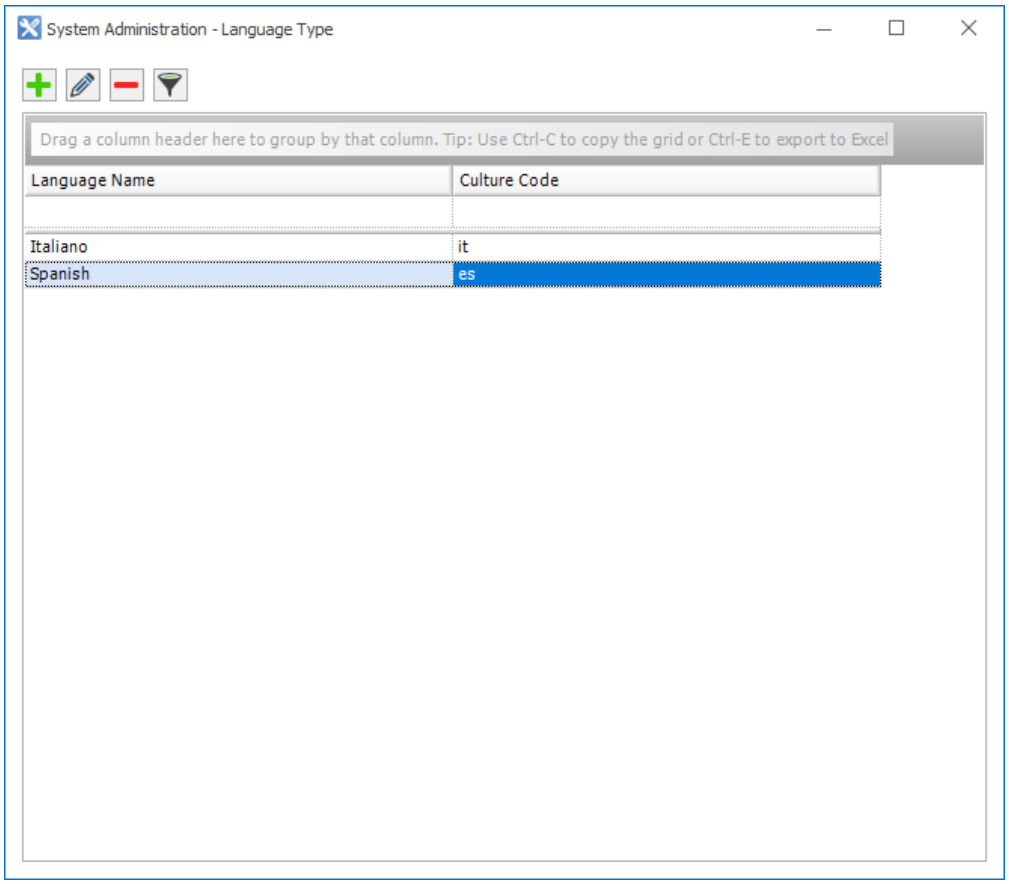

This version includes a feature preview of system data localisation. System data localisation allows AMT Administrators to localise system data (sometimes known as reference data) into any language for which AMT has been configured to use.

For example, using this feature, AMT users configured to use English will see Equipment Criticality descriptions in English, whereas users configured to use French will see the same code descriptions in French.

Defining translated values for system data

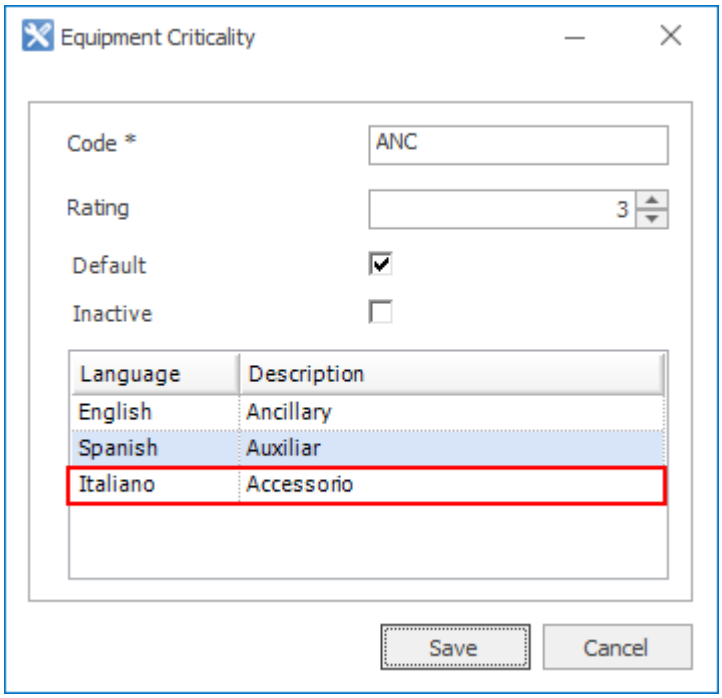

The system data localisation feature works by extending system data editors to allow for a translated value for each system data record to be provided. If a translation is not provided, the original value is used. At run-time, AMT uses the language associated with each user to determine which string to display.

For example, AMT might be configured to support three languages, English, Spanish and French. Here is the **Language Type** system administration screen for such an installation. Note that English is the base language and does not appear in this screen.

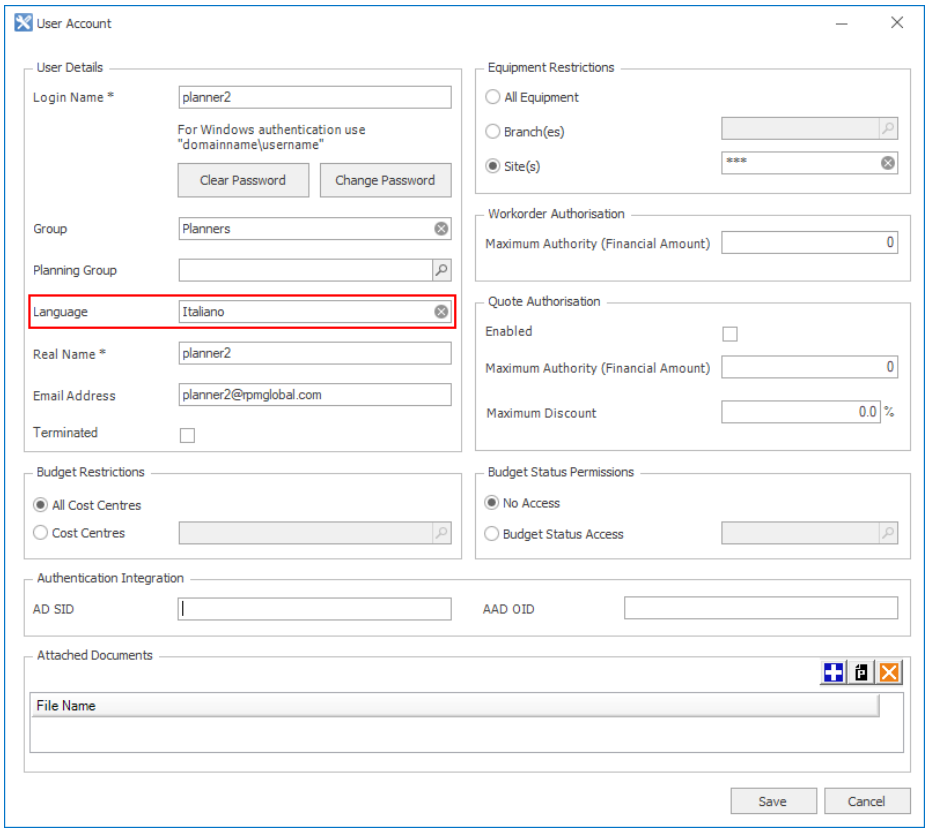

For the equipment criticality code **ANC** (which is fixed across all languages), the Editor allows the user to enter a description for each of the supported languages. If a particular language is not supplied with a translation the English translation is used.

This is how the Equipment Criticality Editor displays:

Wherever the equipment criticality code ANC is displayed, AMT will use the translated description for the code, depending on the language code associated with that user in the AMT user account. For example, the user below is configured to use the Italian translation in AMT, and would see the description as **Accessorio** in AMT.

Scope of support in AM T 8.24

System data localisation in AMT 8.24 is restricted to the following areas:

Budget Status

- System Editor
- Filter controls on all budgeting forms
- Budget Comments Report

Equipment Criticality

- System Editor
- All search controls under Budgeting and Planning
- Search controls or Grid columns in Equipment Editor, Equipment Administration, Multi-Editors, Equipment Creation form, Equipment Selector form, Long-Term Planning and Long Term Planning Advanced forms
- Reports: Plant Hire Invoice Summary, Asset Cost Worksheet, Asset Valuation, Cost Cap Financial Summary, Forecast Worksheet (Dealer Adjusted), Maintenance KPI Summary, Parts Demand Analysis, Production Statistics Analysis, Asset Utilisation

Enhancements

Enhanced Work Order Authorisation Wizard

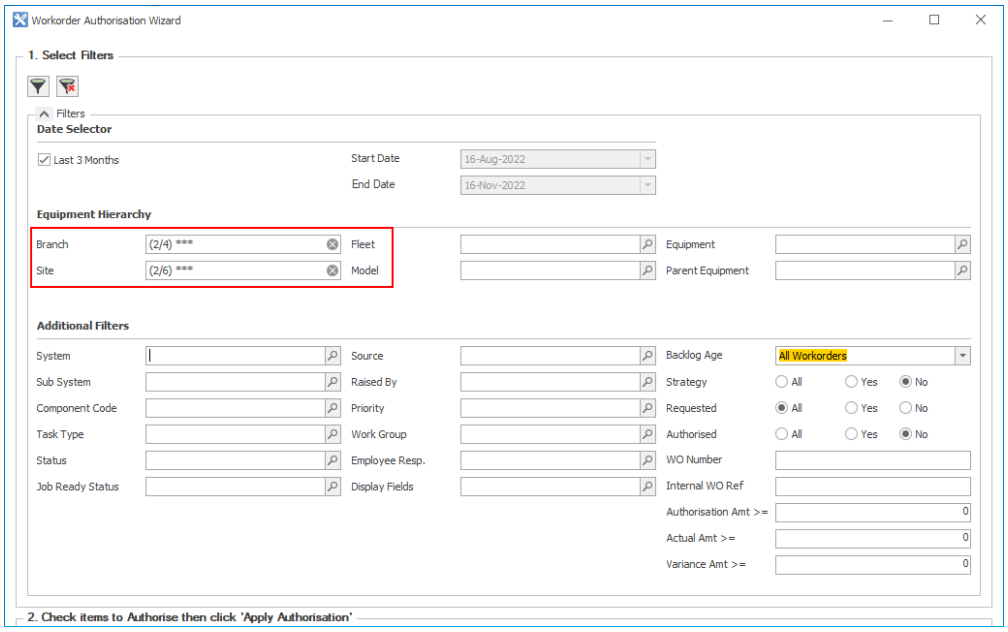

Traditionally, sites operated independently when it came to work management processes. In recent years, and particularly with contractors, planning has become an increasingly centralised task. That is, a central group of maintenance planners and supervisors looking after multiple sites.

AMT 8.24 enables central supervisors, superintendents and managers to authorise work orders across multiple sites efficiently using the existing Work Order Authorisation Wizard.

In this version, the Workorder Authorisation Wizard has been modified so that the **Branch** and **Site** filters are now multi-select.

Both Branch and Site filters continue to recognise the Branch or Site restrictions from the user's User Account settings.

The restrictions, evident on other forms, which prevent AMT from displaying data from the Sites with difference currencies is still enforced.

Optimisations

Functional Location linking

The performance of the internal Functional Location linkage routine has been greatly improved.

Next Due Import

The performance of the Next Due Import function has been improved.

Adding Equipment to Budgets

The performance of adding equipment to budgets has been greatly improved.

Component life achieved calculation

The performance of the component life achieved calculation (part of the Dynamic Life Cycle Costing engine) has been improved.

Strategy Task Filtering via the Equipment > Tasks tab

The performance of filtering Strategy Tasks from the **Equipment** > **Tasks** tab has been greatly improved.

Strategy Task Import

Strategy Task import performance (classing and EPF adapter) has been greatly improved.

Creating work orders from strategy tasks

Additional inherited attributes

In this version, when creating a work order from a strategy task, the following attributes are now inherited from the strategy task to the work order:

- Regulatory Code
- Planning Group

Scheduling groups with one strategy task

This release changes the way the next occurrence is calculated for scheduling groups that contain a single strategy task. This was done to improve performance and also to resolve an issue where the next occurrence may not be calculated correctly.

In this release, the process for calculating the next occurrence when a scheduling group contains only one strategy task is:

- Update the next occurrence of the strategy task to system calculated.
- AMT waits for the DLCC to complete its calculations.
- The next occurrence is recalculated.

SharePoint document links

Being able to link AMT users, equipment, strategy tasks, standard jobs, work orders and checklists to documents housed in external document management systems is a necessary feature of a modern asset management system. Document management systems eliminate the need to store a single document in more than one location. Other systems requiring access to documents are to retrieve the documents from the document management system via hyperlinks.

AMT's document management system - the **Library** module - was developed in the early 2000s and offers only limited functionality. It caters for customers that do not have a document management system, or choose to house asset management documents in AMT (since AMT is the asset management system). However, some

customers may have one or more sites, or strict document control policies, or wish to house all documents (asset related or not) in a single system. For many of these customers, Microsoft SharePoint is used to store documents.

In 2009, AMT was enhanced with the ability to link to external document management systems via a URL reference. This mechanism was suitable for rudimentary links to documents via a URL, but it was not compatible with the linking mechanism used by SharePoint.

In AMT 8.24, this mechanism has been enhanced to allow linkage between AMT Standard Job Operations, Strategy Tasks and Work Orders with SharePoint documents.

Configuration required

A new table, DMS_CONFIG is used to define the type of SharePoint system to be used. Both on-premises and cloud-hosted SharePoint deployments are supported.

Field Name	Value
Name	Root URL of your SharePoint instance.
Type	• 1 for cloud-hosted SharePoint • 2 for on-premises SharePoint
LastModDate	Date/time the record was modified.

For example, if your organisation self-hosts SharePoint, your SharePoint is hosted by Microsoft in the cloud, and your instance root URL is myorganisation.sharepoint.com, you could use the following SQL to configure DMS_CONFIG.

```
INSERT INTO DMS_CONFIG VALUES ('https;//myorganisation.sharepoint.com/', 1, GETDATE())
```

With this configuration in place, whenever a document link is created or accessed from AMT whose rool URL matches the root URL configured in DMS-CONFIG, AMT will access the document from SharePoint.

SharePoint authentication

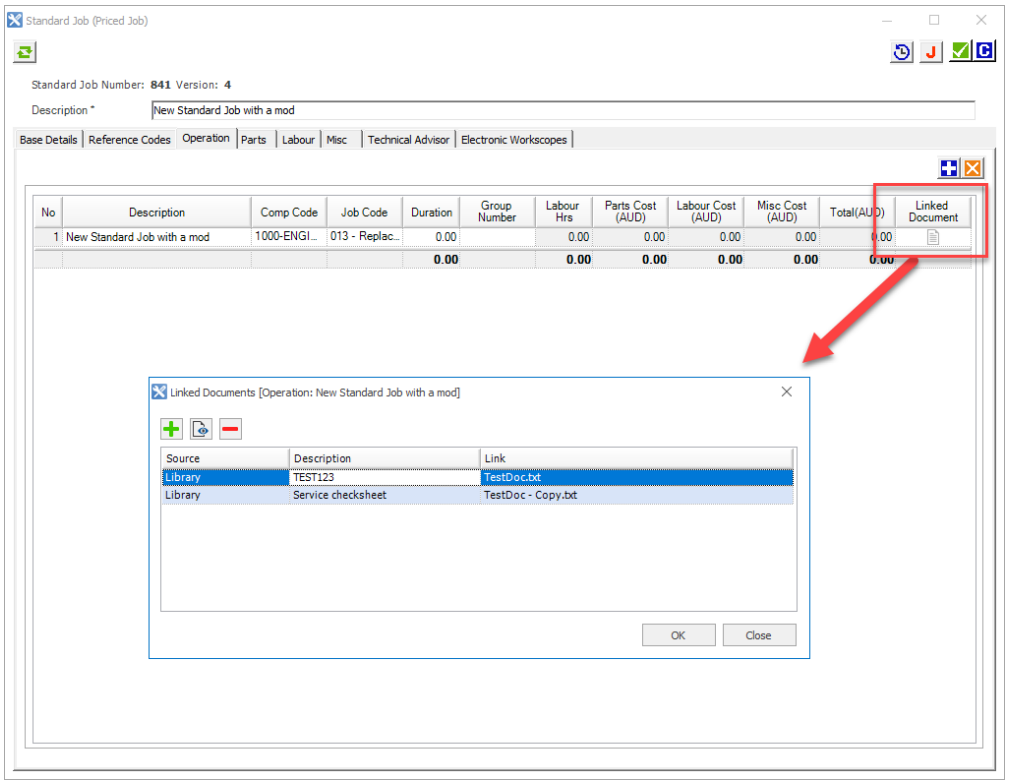

Users will be prompted to supply the appropriate SharePoint credentials to access documents linked in SharePoint from AMT. Use the same credentials you would normally use to authenticate SharePoint.

Linking SharePoint documents

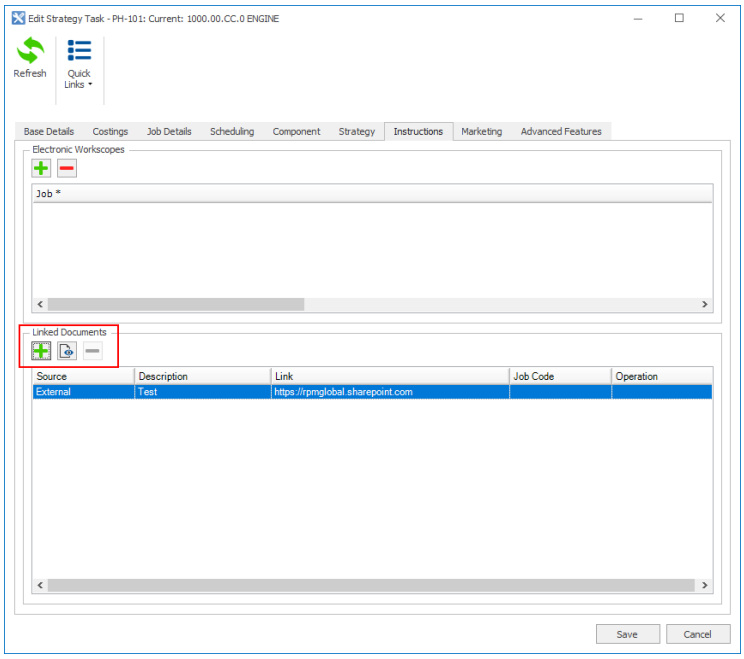

SharePoint documents can be linked to:

- Standard Job Operations
- Strategy Tasks (Instructions tab)
- Work Orders (Planning tab)

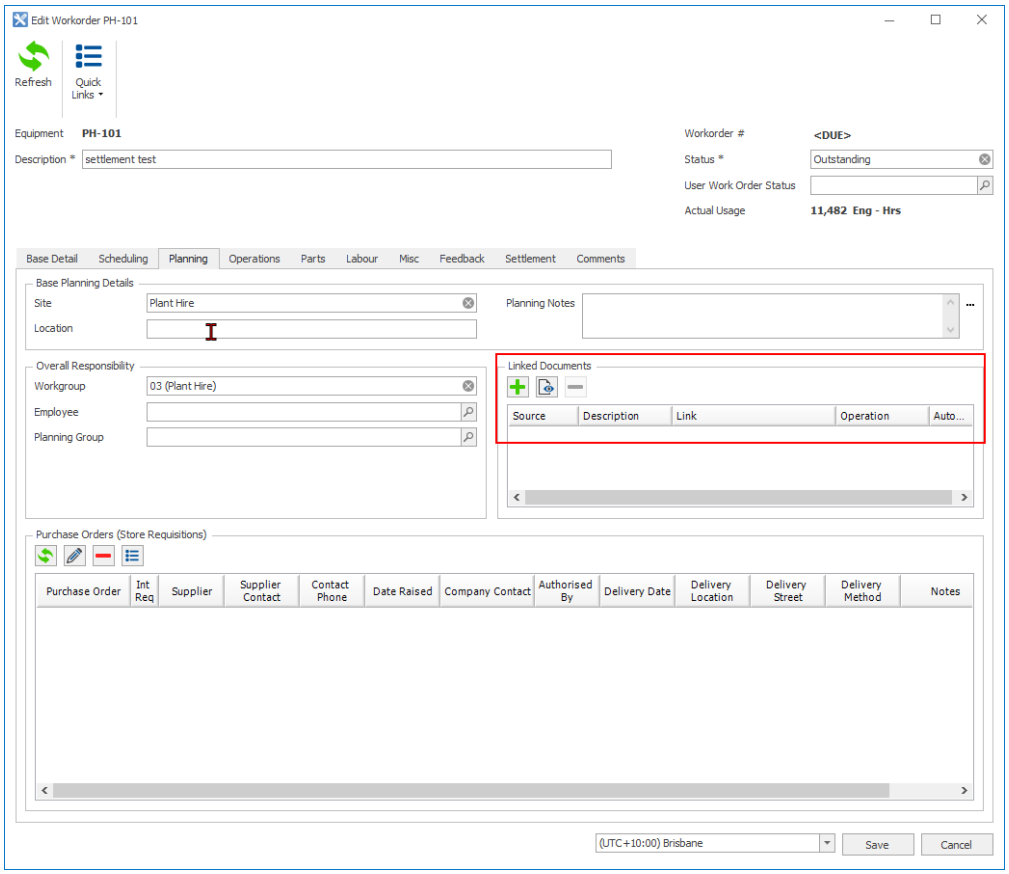

Standard Job Operations

Strategy Tasks (Instructions tab)

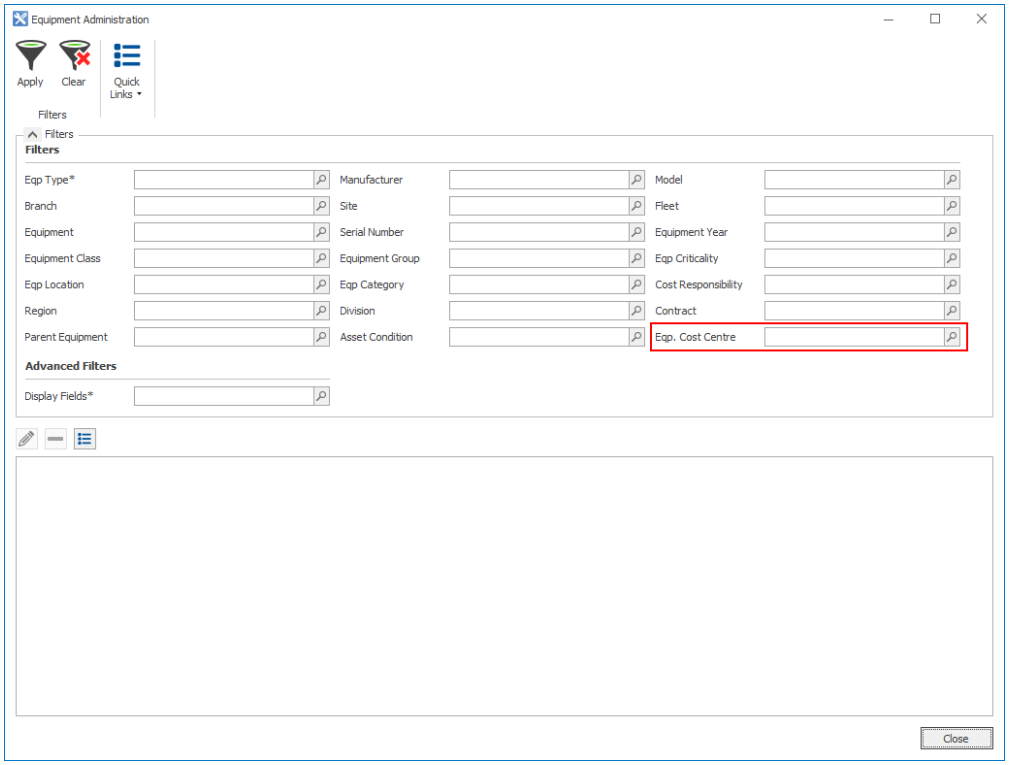

Work Orders (Planning tab)

Add Cost Centre filter to Equipment Administration

A new multi-select filter has been added to the Equipment Administration form, **Eqp.Cost Centre**.

Long-term Planning - Shutdown Planning

The Long-term Planning - Shutdown Planning form calculates scheduled frequency correctly for all occurrences except the first one in the grid.

The first occurrence in the grid may not be the next occurrence of the strategy task. This may happen if the user selects a date range or STO via filters that do not include the date of the next occurrence.

In this release, the rules used to calculate the scheduled frequency have been changed.

1. If the first occurrence is not the next occurrence of the strategy task:
   (scheduled frequency) = (previous occurrence usage) - (first occurrence in the grid usage).
2. If the first occurrence in the grid is the next occurrence:
   a. Check if the strategy task has settlements linked. If so, use the last occurrence as the starting point.
   b. If there are no settlements linked, check if there is a last changeout usage entered.
   If last **changeout usage > 0**, use the last changeout usage as the starting point.
   If last **changeout usage = 0**, use the equipment start usage as the starting point:
   (scheduled frequency) = (starting point usage) - (first occurence in the grid usage).

New Standard Job import mode

AMT has both the concept of a **Standard Job** and a **Priced Job**.

The Standard Job contains the core details of the job, including the job's status, codes, planning parameters, operations, parts/labour/misc requirements, technical advisor details and linked electronic workscopes. The Standard Job also contains costs.

A priced job in AMT is where the unit costs (expressed in a nominated Currency) for parts (sourced from Price Groups) and for labour activities (sourced from Branch labour rates), associated with a standard job can vary. Misc costs are also contained in a priced job (but are not influenced by Pricing Group or Branch).

AMT has long supported the ability to import Standard Jobs using a variety of methods, including:

- File-drops
- Builder
- EPF Adapters

Historically, all import methods followed the same procedure:

The Standard Job's details are updated, and only the cost of the single Priced Job (referenced in the load data) is updated (costs, labour hours, duration). For example, if the strategy task is in a Current or Centreline projection, the strategy task should update to reflect the updated Priced Job. Otherwise, the costs of strategy tasks did not automatically update (for example, Estimate-Current, Estimate-Draft, Alternate, Archive).

In AMT 8.24, a new method is available for import:

The Standard Job's details are updated, and all Priced Jobs linked to that standard job are updated (costs, labour hours, duration). The cost of strategy tasks linked to the Priced Jobs are updated or not updated based on existing rules. For example, if the strategy task is in a Current or Centreline projection, the strategy task is updated to reflect the updated Priced Job. Otherwise, the costs of strategy tasks should not automatically update (for example, Estimate-Current, Estimate-Draft, Alternate, Archive).

The original mode is still the default. No changes occur unless a new configuration option is set.

This new mode is controlled by a new AMT_TYPED_VARIABLE setting, **StandardJobImportUpdateAllPricedJobs**. When set to **0** (or not defined), the original behaviour is unchanged. if set to **1**, regardless of what Pricing Group or Pricing Branch is selected in the Wizard (through the user interface) or in the message (through interface), costs will be updated to all Priced Jobs (apart from the ones marked as Overwrite All - Fixed Cost).

Standard Job Expense Allocations on Strategy Tasks

Background

AMT does not provide an inventory management solution; parts held in AMT are a list of 'catalogue' items. In an ERP, the distinction is that parts are first catalogued and then a determination is made whether to assign a stock code within a catalogue. In the ERP you may have catalogued parts that do not have a stock code. Within the ERP there may not be a one-to-one relationship between a catalogued item and an inventory code (stock code).

It is possible that an inventory code may have one preferred part number and additional catalogued parts referenced as parts ranked in order of preference.

Within an ERP, it is the inventory item that has an assigned expense element. This means that catalogued parts referenced to the same stock code inherit this expense code financial dimension; and if several catalogued items were referenced to the same stock code, they would inherit the same expense code financial dimension.

Generally, an ERP defines expense elements for inventory with one expense element being the default if no specific expense element is identified on the record. Most inventory stock will generally default on a common expense element; then there are about 10-20% of stock items that an organisation may wish to identify with different expense codes. Examples would be Grease and Oils, Diesel, Tyres, GET and so on.

There is a need to be able to allocate the parts, labour and miscellaneous expenses across multiple expense elements. For example, mechanical labour and electrical labour may be represented by different expense elements; as may gaskets, seals and packing differ from pipes, valves and fittings, and grease and oil. ERP solutions can support this, but AMT does not.

AMT needs to support the allocation of parts, labour and miscellaneous costs on a standard job across multiple expense elements; and this needs to persist up through the Strategy Task and Work Order.

Current functionality

AMT holds parts only within its **Parts Manager** and provides inventory look-up functionality to a customer's ERP.

AMT provides four cost sources on a strategy task job to support costing. These four cost sources are Manual, Standard Job, Cost Allocation and Consumable. The Cost Allocation option currently allows the user flexibility to allocate the job header costs over multiple financial dimensions. Standard Job and Manual cost sources provide only the ability to assign job header costs to one cost centre and an expense element for each of parts, labour and misc.

New functionality

Customers need to be able to allocate the costs associated with Standard Jobs across one or more expense elements depending on the part, labour activity or misc category chosen.

To accommodate this requirement, expense elements can now be associated with parts, labour and misc costs on a Standard Job. Rather than add these codes when each Standard Job is created (which would be an inefficient process), the codes are associated with parts, labour activities and misc items themselves and these will be passed through and inherited by the Standard Job. They may be overwritten on the Standard Job. If overwritten on the Standard Job, they will not be updated.

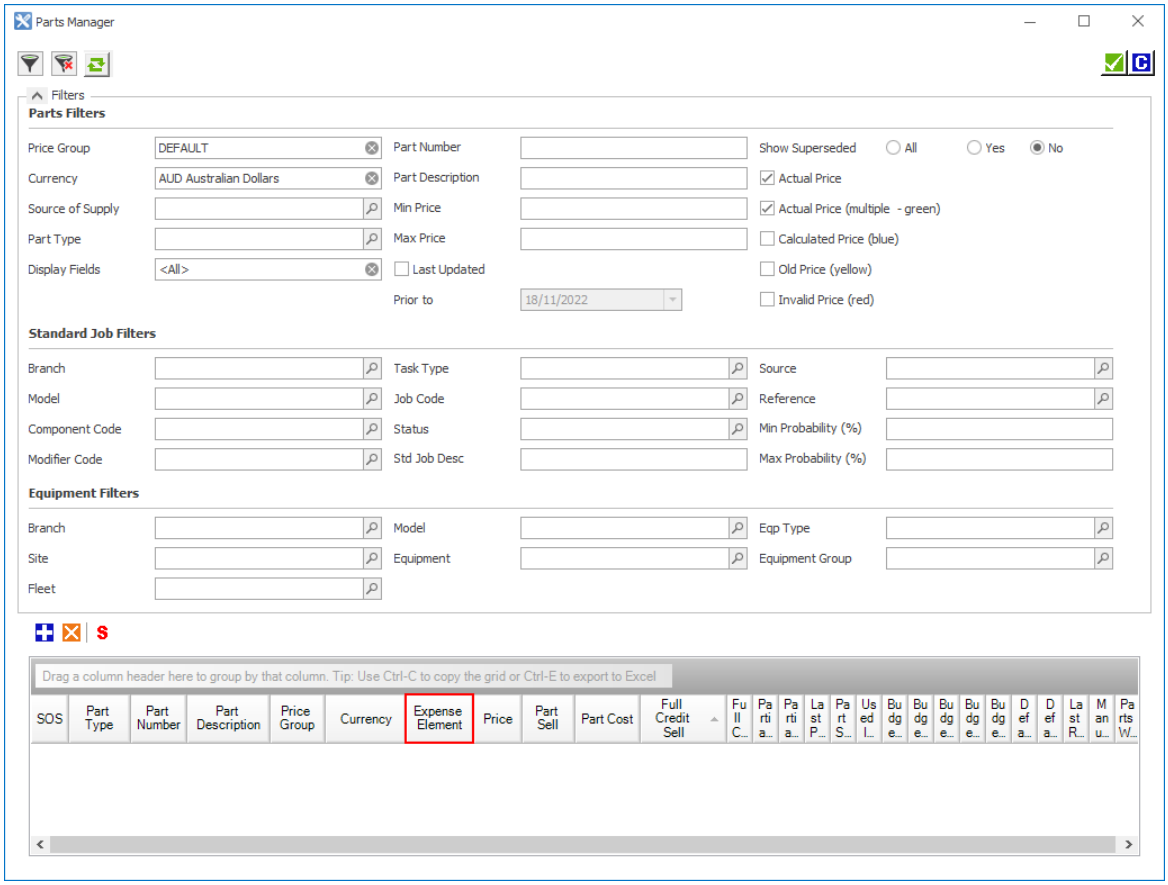

A default expense element for parts, labour and miscellaneous will be identified. This default expense element will be the expense element used for Standard Job Cost Allocation if the part, labour or miscellaneous item included on the Standard Job does not have a uniquely identified expense element.

Expense Element has been added as a display field to:

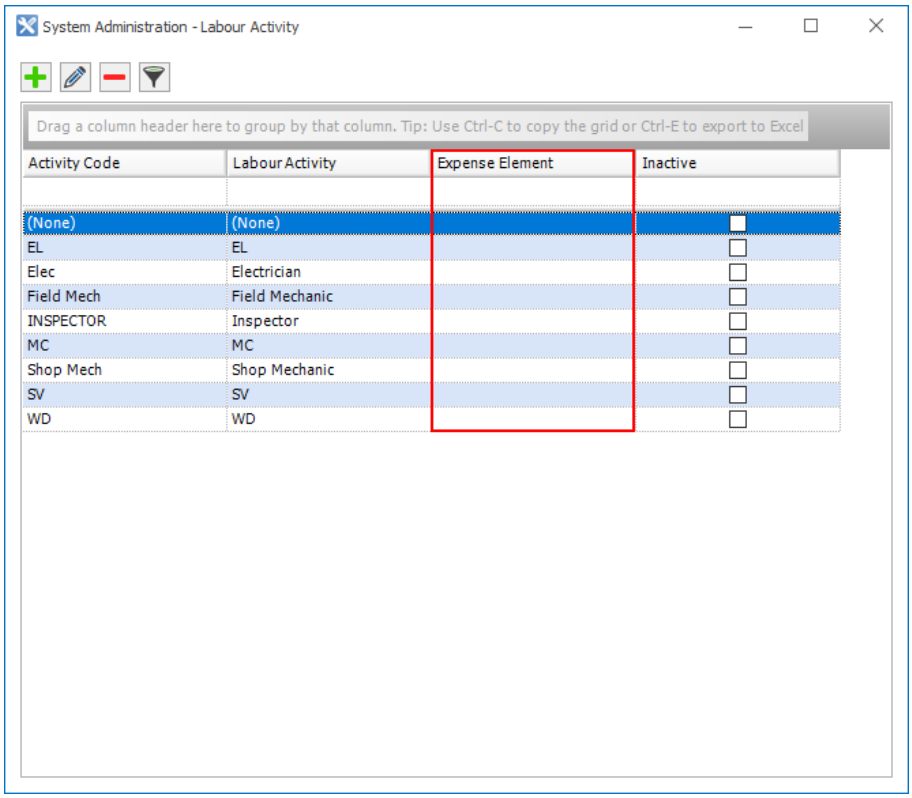

- Parts Manager
- System Administration > Parts & Standard Jobs > Labour Activity.

- System Administration > Maintenance > Task Misc Category
- Standard Job (Priced Job) Editor > Parts tab

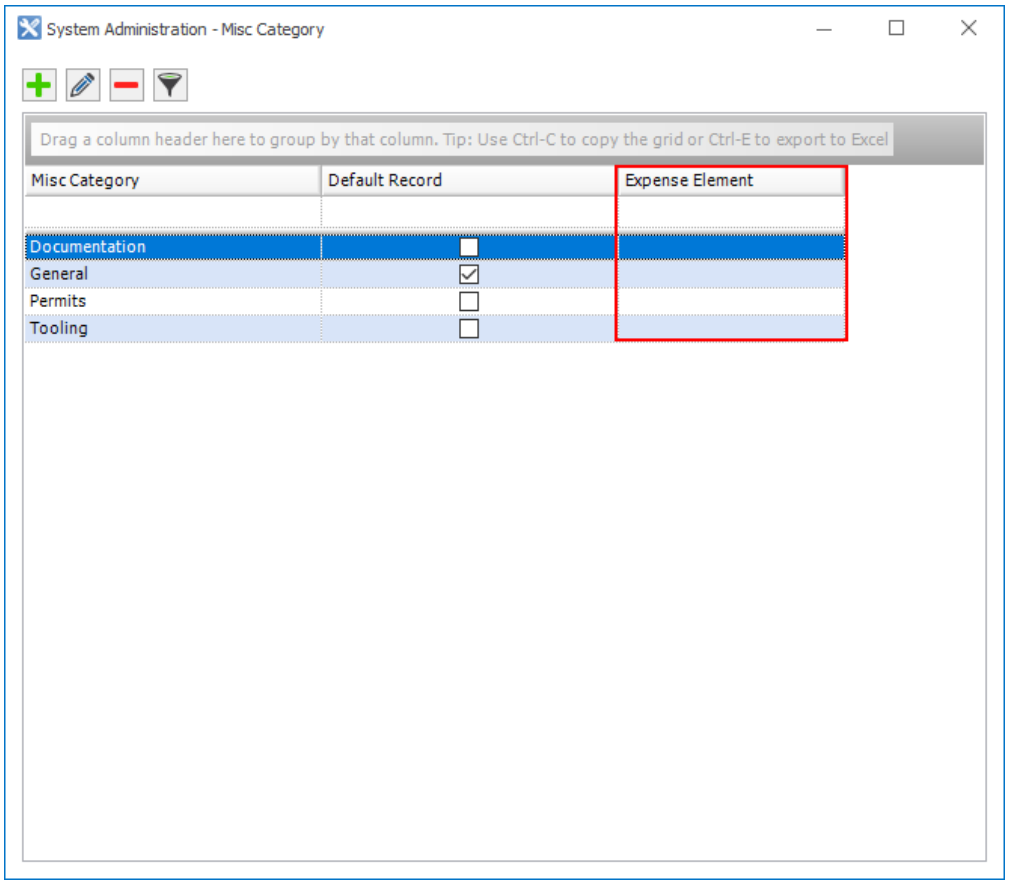

Parts Manager

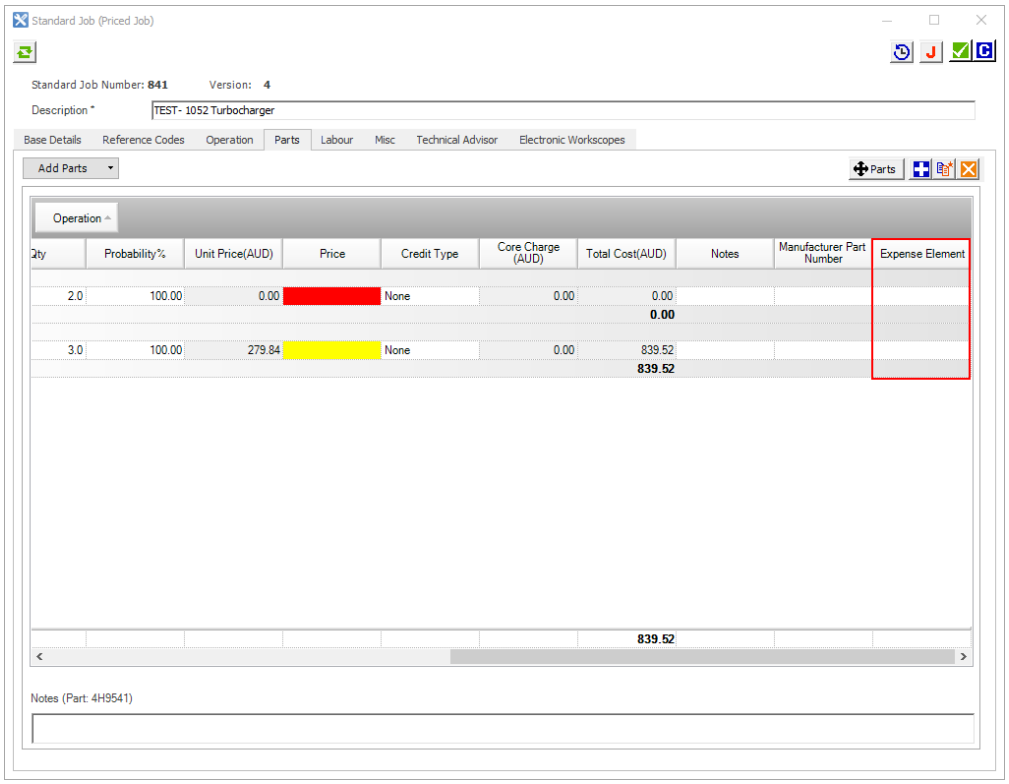

Labour Activity Editor

Misc Category Editor

Standard Job (Priced Job) Editor Parts tab

Strategy Task modifications

On the Strategy Task 'Task' job, when the user selects a Standard Job as the cost source, the process in AMT then brings the Standard Job Expense Allocation through to the Strategy Task Task Job and allocates the cost centre, work centre and so on from either the Task Job, the Equipment record, or leaves it blank if no default information is known.

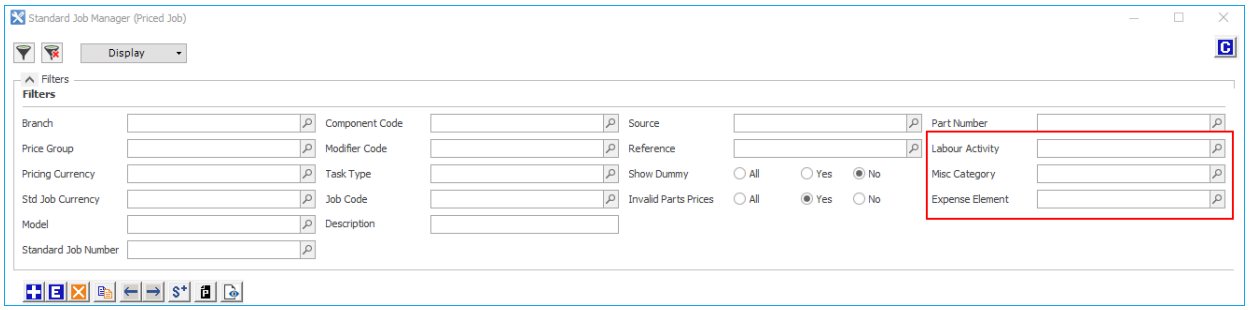

No changes are allowed to the $ on the expense allocation.

When the Standard Job expense allocation is associated with the Strategy Task, AMT will build the Cost Allocation from known information from the related Task Job or Equipment. Cost Centre (if recorded on the Task Job) or the Equipment Cost Centre will display on the Cost Allocation screen.

When a job cost source is Standard Job, the three Expense Element fields are hidden.

Standard Job Manager updates

Three new multi-select filters - **Labour Activity**, **Misc Category** and **Expense Element** - have been added to the Standard Job Manager (Priced Job).

New configuration for AMT Mobile 2.0

New configuration has been added to support AMT Mobile 2.0. See the **M310 Configuration** document for details.

Fixes

Functional Area	Fix	Work Item	Case ID
Budgets	Fixed an issue where linked STO and Long Wall Mining maintenance points were being unlinked from the next occurrence when settlements were completed.	51139	163156
	Fixed an issue where selecting the status filter on the **Budget and Forecast Manager** > **Budget Header Manager**, but not selecting a status, refreshing, then selecting the status again could result in an error.	49514	
	Fixed an issue where failed **Budget System Tasks** were not retried. In this version, budget system tasks will be retried three times before being reported as failed.	46778	
	Fixed an issue where the budget system task would fail if a user who did not have the access to all equipment in a budget executed any of the budget **Data Update Routines** (Replace usage with actuals, Replace costs with actuals/current projection and Replace actual costs to Month).	46838	
	Fixed an issue where an unclear message was displayed when a user updated plant revenue details for equipment they do not have access to.	46924	
	Fixed several missing translations in the **Budget** > **Add Equipment** screen.	47112	
CBD	Fixed an issue where the **Capex** check box on the **Strategy Task Editor** form was not visible when the CBD function was configured. In this release the Capex check box is always visible.	46337	
	Fixed an issue where the **Revalue Depreciable Asset** dialog box would allow any user to approve the revaluation. In this release, only users with access to the asset can approve its revaluation.	35888	

Functional Area	Fix	Work Item	Case ID
Dashboards	Fixed an issue where **Dashboard reports** were not being updated due to an overflow error that could occur when importing data into the IC database.	50584	144198
Data Models	Fixed an issue where rows could be duplicated in the **OccurrenceDataModel.FutureOccurrence**. In this release, the OccurrenceDataModel.FutureOccurrence returns consolidated PLM costs/hours records.	48453	162389
	Fixed an issue where the **SystemTableDataModel.OperationalCriticality** data model was missing.	46741	161664
Defects	Fixed an issue where the **Edit** button was not functioning on the **Quick Backlog Capture** form.	48422	158618
DLCC	Fixed an issue where the DLCC projection recalculation process could fail due to a data type overflow.	49604	
	Fixed an issue where the DLCC could fail if an equipment had multiple billing schedules.	50091	164432
	Fixed an issue where some projections would still be flagged as requiring re-calculation even though they had been processed.	46740	161657
	Fixed a timing issue where updating strategy task next occurrences via integration may cause a projection to be quarantined by DLCC.	36677	
Documents	Fixed an issue where deleting library documents linked to strategy tasks would result in an error. In this release, a message is displayed to the user advising that the document must be unlinked from strategy tasks first.	49480	163884
Employees	Fixed an issue where an employe's **Default Labour Activity** would change when the employee labour activities for an existing Employee Site.	50646	
	Fixed an issue where it was not possible to update the **Work Group** or **Labour Activities** for an existing Employee Site.	46725	

Functional Area	Fix	Work Item	Case ID
Equipment	Fixed an issue where double-clicking the first equipment displayed on the equipment tree in sibling mode would have no effect.	49952	164335
	Fixed an issue where the **create strategy tasks from standard jobs** process created modelling equipment strategy tasks with $0 costs.	49169	163514
	Fixed an issue where copying equipment as a different type would maintain any parent/child asset relationship, even if the new asset was a different type to the parent. This behaviour would cause the **Siblings Mode Equipment Type** filter to fail.	47226	162346
Events	Fixed an issue where marking an event as complete would result in the event being returned to YTS when reopened. Closing it a second time would work.	50338	160509
	Fixed an issue where deleting an STO from an event did not also remove the STO link from work orders associated with the event.	47271	
Excel	In previous versions there was no limit set to the number of records that could be exported to **Excel** from the **Component Changeout Grid**. This meant it was possible to export more data than Excel could handle, resulting in a memory overflow error. In this release a limit of 50,000 records has been applied to the filter.	30686	139371
Export	Fixed an issue exporting unicode characters via the **Export Strategy Tasks** feature.	51618	166032

Functional Area	Fix	Work Item	Case ID
Integration	Fixed an issue where the **Auto Create External Work Order** feature would fail to execute.	47346	
	Fixed an issue where importing job costs was wiping out the parts expense element in cost allocation details.	47083	162084
	Fixed an issue where calling **ProcessUsageReading()** could fail if the payload contained a **%** character.	51923	166057
	Fixed an issue where the **Inventory Validation** function could erroneously send a Work Order Create message to the ERP instead of an Inventory Validate message.	50236	
	Fixed an issue where importing defects did not apply the default work group to created defects.	48742	163140
	Fixed an issue where importing a CSV file using the **Last Occ Import** function could result in every successful imported row being reported as an error.	34912	146964
	In previous versions, branch code uniqueness was not being applied when importing standard jobs. In this release, branch code uniqueness is enforced.	48912	163326

Functional Area	Fix	Work Item	Case ID
Mobile 1.0	Fixed an issue that could make it impossible to resume an inspection in offline mode.	47594	161691
	Fixed an issue where it was not possible to supply decimal values while recording measurements.	39681	153317
	Fixed an error where some inspections could not be started due to a missing STO column in the database.	48113	
	Fixed an issue where offline inspections could fail to sync due to issues updating geolocation data included in the inspection.	45609	158743
	Fixed an issue where the **InspectionDataModel.InspectionDetails** data model would not be populated with the **Performed By ID** for offline inspections.	47319	160485
	Fixed an issue where, under certain circumstances, it was not possible to resume an inspection in offline mode. (In offline mode, resuming an inspection would start a new inspection.)	45006	158507
Notifications	Fixed an issue where notifications raised via measurements would have different **Date Raised** value depending on the measurement source.	32734	144503
Parts Forecast	Fixed an issue where the **Parts Forecast** process could generate errors depending on the length of associated work order numbers.	49756	164153
Planning	Fixed an issue where loading the **Long Term Planning** screen could result in an unreasonable delay (10-15 minutes).	48913	163327
	Simplified the message displayed when updating the last occurrence and active calculations are being performed.	50522	16489
	Fixed an issue where the Update Planning from Strategy task process could fail.	50165	164508
Printing	Fixed an issue where bulk job folder printing could fail due to missing maintenance order type data.	50648	164918
	Added the missing **Asset Condition** filter to the **Job Folders - Bulk Printing** screen.	47408	

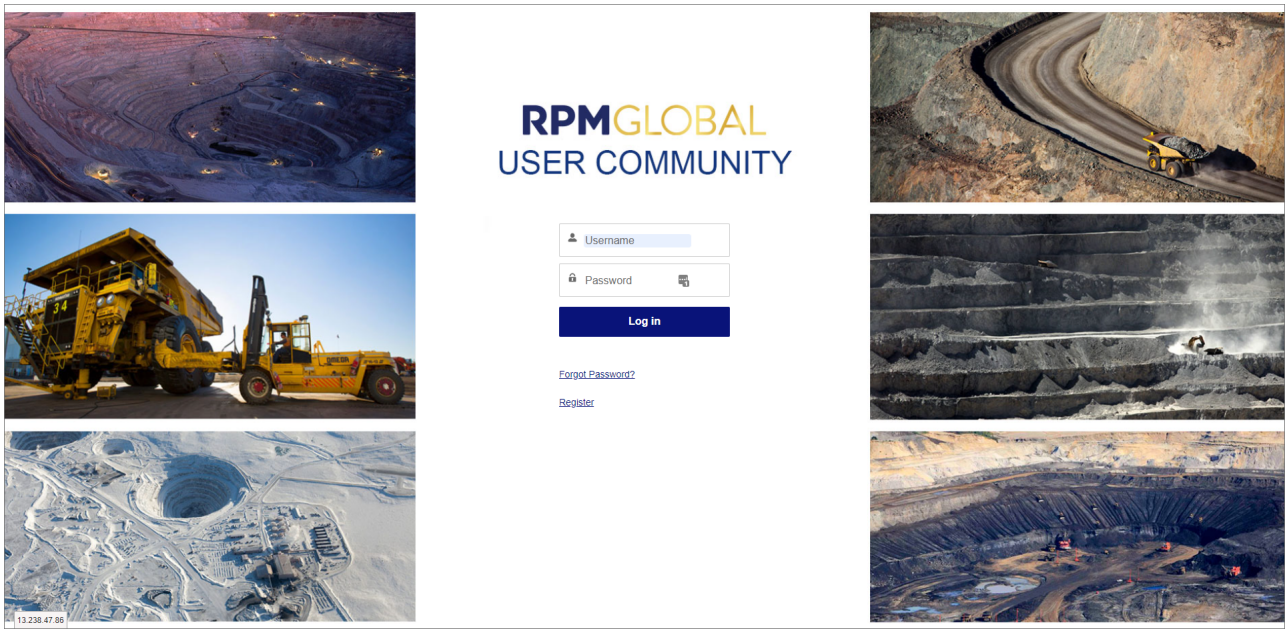

Functional Area	Fix	Work Item	Case ID
Projections	Fixed an issue where creating **alternate projections** for an entire fleet would include terminated equipment.	48824	163230
Quoter	Fixed an issue where the projected occurrences of equipment, when recalculated, were not being based off the start hour supplied by Quoter.	48333	162838
Readings	Fixed an issue where when adding usage readings to multiple equipment via the record, actual usages would incorrectly mark all usages as invalid if one usage was invalid. In this release, each new reading is validated against the previous reading for the specific equipment.	44127	157807
Reports	Fixed an issue where the **Projection Summary** and **Cost Per Interval** reports could show the wrong cost of modelling equipment.	47200	162286
	Fixed an issue with the **Forecast Worksheet - @Cost** report where an error would occur if a description was supplied in the report parameters screen.	50718	164944

Functional Area	Fix	Work Item	Case ID
Reports	Fixed an issue in the **Equipment Cost Analysis** report where the task counter filter was not being applied to the results.	51787	166092
	Fixed an issue in the **Scheduled Hours** report where the date selector was displaying the incorrect caption.	28981	135814
	Fixed various issues in the **AMT Audit Log** report, including logging of event downtime, missing work order number, missing description and the incorrect timestamp for some deleted records.	51234	
	Fixed an issue in the **Component Changeout Analysis** report where no results would be included if a value was supplied in the **Strategy Task Description** filter.	50125	164489
	Fixed an issue with the **Component Status** report where null current usages would be shown for equipment where imported usages were dated in the future.	35171	148063
	Fixed an issue with the **Component Status** report where the next changeout details date could sometimes be reported incorrectly.	51159	164931
	Fixed an issue where the **Cost Analysis - To Date** report would incorrectly report that projections needed to be recalculated.	49467	163890
	Fixed an issue where the **IC Extract Process** (which refreshed data used by several reports) could timeout.	48745	163159
	Fixed an issue in the **Forecast Work Sheet - @Cost** report where an error would occur when certain date ranges were supplied.	48734	
	Fixed an issue where the **Hours to PM** report could time out, not returning any data.	45824	158986
	Fixed an issue in the **Mean Time Between Failure** report where fleet names were not legible.	50171	164546
	Increased the timeout associated with the **Parts Demand Analysis** report.	50851	164766

Functional Area	Fix	Work Item	Case ID
Reports	Removed the activity filter from the **PCV Chart** report. (**Maintenance Order Type** should be used.)	47106	
	Fixed an issue where the **Shift Down Summary** report was not filtering properly on task type.	47219	162291
	Fixed an issue where the **What-if - Life Cycle Analysis** report would cause an error if a site filter was supplied.	51403	
	Fixed an issue where the **Timesheet Cost Analysis** report could time out.	48150	16267
	Added the missing **Planning Group** and **MOT Group By** options to the **Workplan - Work Order Summary** report.	47330	
Standard Jobs	Fixed an issue where some XML files could cause the **Import Standard Jobs** function to fail.	50675	
	Fixed an issue where the **Standard Job Manager** could create duplicates (and the duplicates could not be deleted).	49532	163911
	Fixed an issue where the values displayed in the **Base Details** and **Grid Views** of the **Standard Job Manager** did not match.	48248	162059
	Fixed an issue where when a standard job/technical advice was created from a work order, the job code information was not being inherited by the standard job/technical advice.	50793	
STO	Fixed an issue where STO's were not being validated against the site associated with the equipment being assigned to the STO.	47230	
	Fixed an issue where several labels on the **STO Manager** > **Create STO** form were not correctly translated.	47110	

Functional Area	Fix	Work Item	Case ID
Strategy Tasks	Improved the performance of the **Copy Strategy Tasks** function.	50945	165110
	Fixed an issue where deleting external linked documents via the Strategy Task Multi-Editor would result in an error.	49586	163636
	Fixed an issue where deleting actual usages, where one usage had an issue, could cause all subsequent usages to be labelled with the same invalid reason message a the one invalid reading.	49566	163861
Work Group Admin	Fixed an issue where **deleting a work group** could result in an error.	44101	158634
Work Orders	Changed the **Work Order Authorisation** screen to accept multiple sites in the site filter.	43299	157378
	Fixed an issue where it was possible to create duplicate part number and supplier combinations in work order operation parts even if the configuration setting **AMT TYPED VARIABLE** > **DisabledDuplicatedPartandVendor** is enabled.	48904	162403
	Fixed an issue where editing a work order that is not complete, and setting the **Skip work order** check box then refreshing would result in an error.	51103	
	Fixed an issue where deleting an existing defect from the new work order screen could result in an error.	44132	158618
	Fixed an issue where adding technical detail to a work order settlement could result in an error.	45344	
	Fixed an issue where work orders created from standard jobs could show the incorrect duration.	43407	156408

Version Number 8.23 U1

The following is a list of all changes and updates addressed in AMT Version 8.23 U1.

Overview

AMT 8.23 U1 is a maintenance release of AMT 8.23. It contains bug fixes and minor enhancements to **Daily Planning**, **Work Orders**, **STO**, **Budgeting & Forecasting** and **Timesheets**.

New Features

Daily Planning

Daily Planning > Planning > Express Add Workorder

When using the **Planning** > **Express Add Workorder** option (on the **Edit** button drop-down), the planning group of the created work order now defaults to the planning group of the current user. If the current user is a member of multiple planning groups, the work order planning group is left blank.

Daily Planning > Planning > Backlogs

The **Operational Criticality**, **Requires STO**, **Risk Rating** and **Risk Override** filters and display columns now display data.

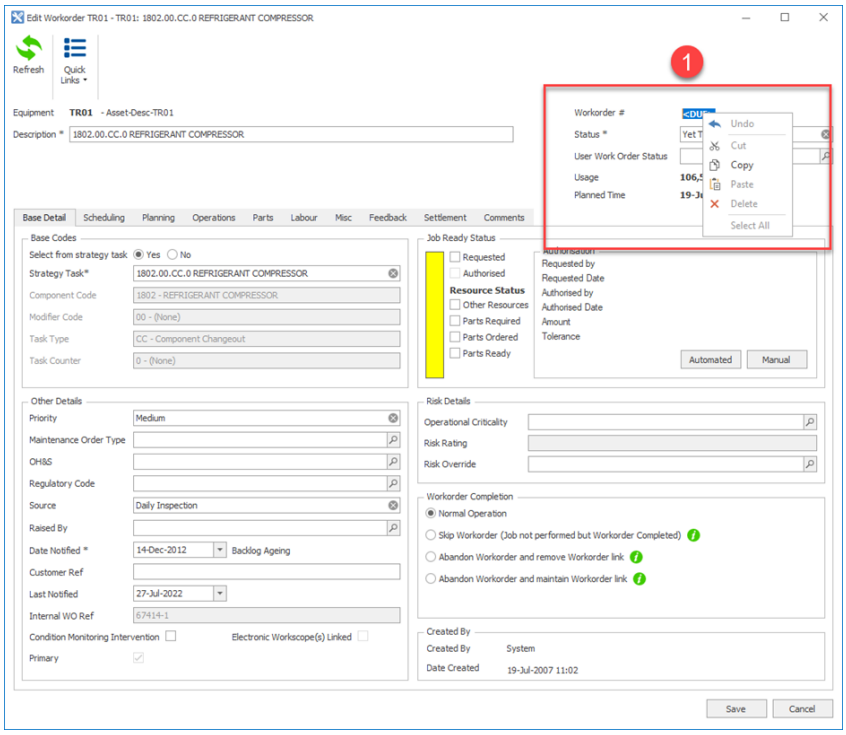

Planning Reports

The following reports have been extended to include **Maintenance Order Type (MOT)** and **Planning Group**:

- Asset Utilisation Report
- Downtime Analysis Report
- Event Analysis Report
- MTBF Report
- MTBUPS Report
- Availability to Target Summary Report
- Availability – Physical Report
- Availability – Mechanical Report
- WO Authorisation List Report
- WO Status Audit Report
- Job Folders (Bulk Printing)
- WorkPlan 2 Report
- Planning Status Report
- Workplan – Workorder Summary Report
- Overdue Strategy Tasks Report
- Equipment Backlog Listing Report
- Daily/Weekly Work Plan Report

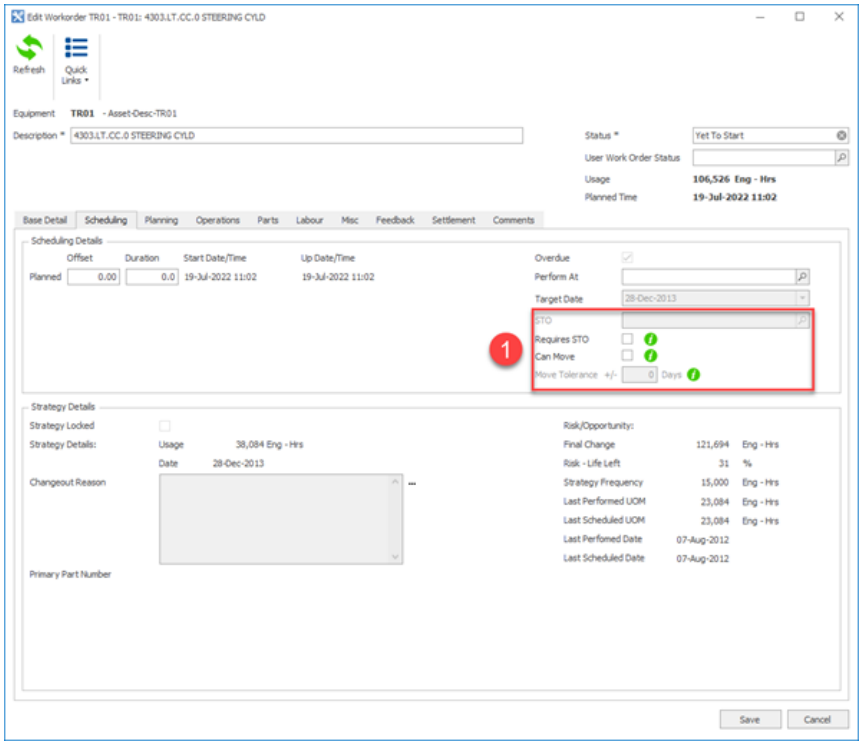

Work Orders

Edit Workorder

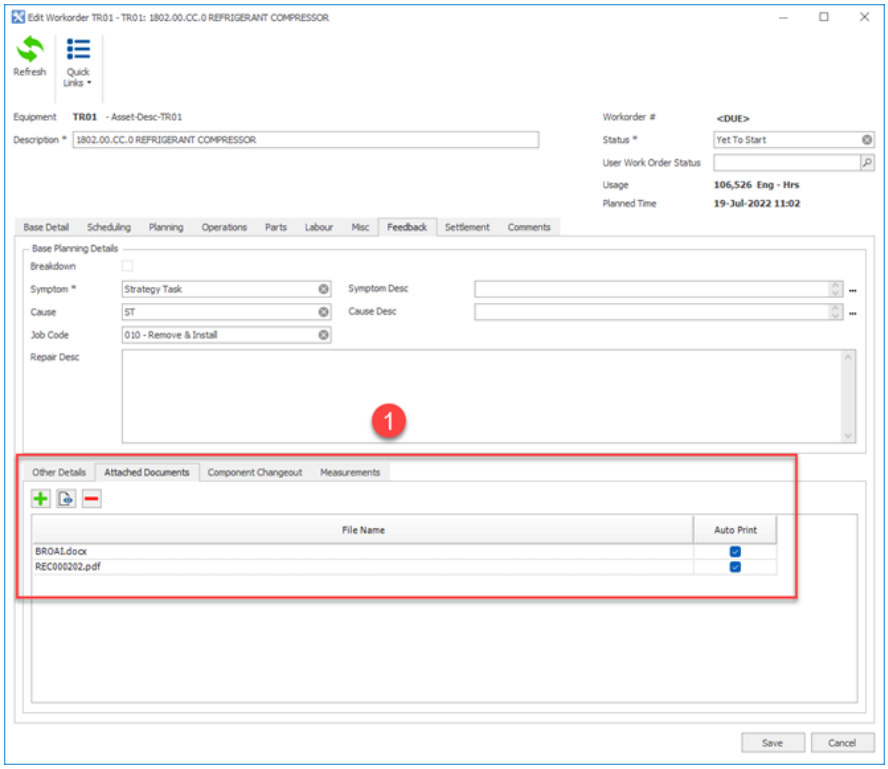

1. The **Workorder #** text is now selectable and can be copied to the Windows clipboard.

Edit Workorder > Scheduling

1. **STO**, **Requires STO**, **Can Move** and **Move Tolerance** have been exposed on the **Workorder** > **Scheduling** tab.

Edit Workorder > Feedback > Attached Documents

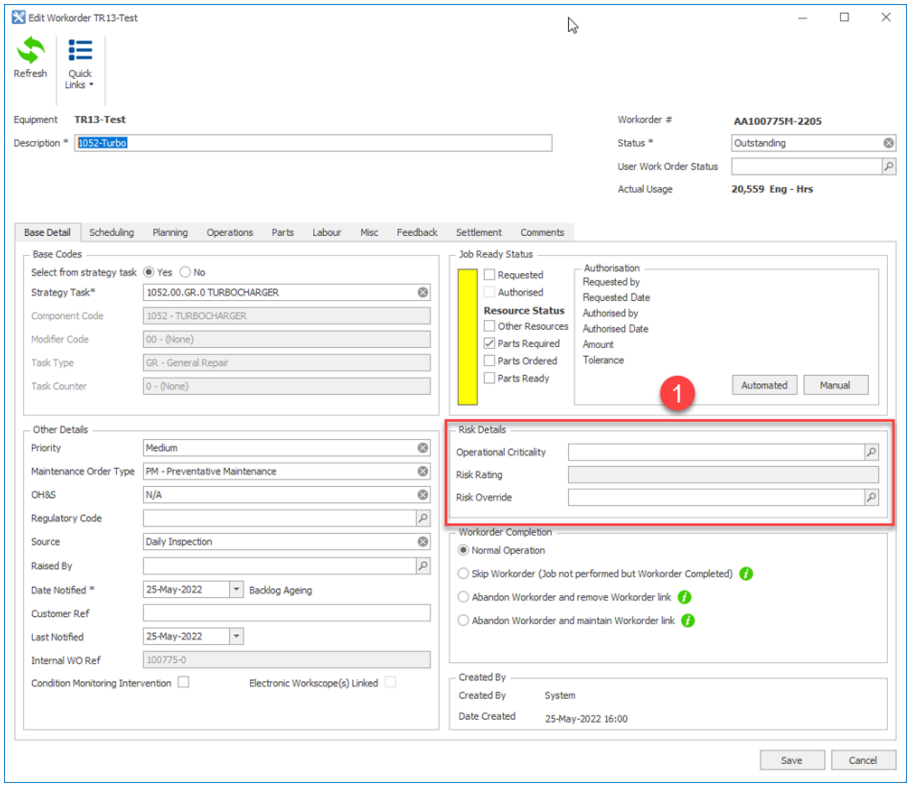

1. In previous versions, attached documents were renamed by appending a unique string to the end of each document's filename. This was done for legacy technical reasons. In this version, the original filename is retained.

Risk Management

The **Risk Management** feature first made available in AMT 8.23 has been enhanced to include the calculation of a risk rating for work orders. (See the 8.23 release notes for more information about the AMT Risk Management feature.)

Edit Workorder > Base Details tab

1. A new section, **Risk Details**, has been added to the **Workorder Base Details** tab. Initial values are drawn from the strategy task used to create the work order (if applicable). **Operational Criticality** may be manually edited. When the work order is saved, the **Risk Rating** value is calculated. Users may optionally override the calculated Risk Rating by selecting a value from the **Risk Override** search control.

Planning > Planning Grid

1. The **Planning Grid** has been extended with three new optional display fields: **Operational Criticality**, **Risk Override** and **Risk Rating (Calculated)**. Operational Criticality and Risk Override values can be edited directly in the grid.

Business Rules

- If a work order is created from a strategy task, the default value for **Operational Criticality** is inherited from the source strategy task. The inherited value is read-only until the work order is saved.
- If a workorder is created from a strategy task, the default value for **Risk Override** is inherited from the source strategy task. The inherited value is read-only until the work order is saved.
- **Risk Override** is disabled for new work orders until the work order has been saved.
- **Operational Criticality** and **Risk Override** can only be updated for work orders with a status of **Outstanding**, **Yet to Start** or **Deferred**.

Shutdown, Turnaround, Outage (STO)

Auto Create Work Order from Strategy Task

The **auto create work order from strategy task** process has been extended to include the STO attributes **Requires STO**, **Able To Move** and **Move Tolerance** from the strategy task when creating work orders.

Budgeting & Forecasting

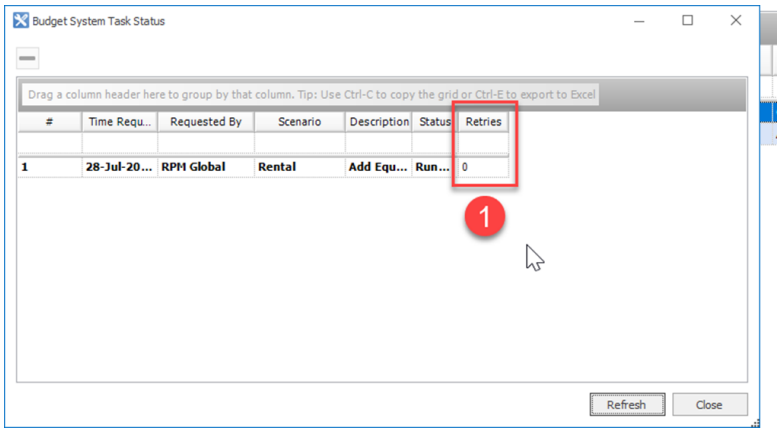

Replace Equipment Plant Revenue Details Performance

The performance of the **Replace Equipment Plant Revenue Details** function has been improved by moving the processing to a system task.

Budget System Task Retry Mechanism

From AMT 8.23, several budget processes were changed so they are executed under the control of the **Budget System Task Manager**. This was done to improve the performance and scalability of the budget feature. In the initial implementation, it was possible for a budget system task to fail. If this happened, the user needed to manually restart whatever budget process failed.

In this release, a failed budget system task is automatically re-run up to three times. If it fails after three attempts the task is abandoned, and a record is written into the AMT BUDGET_ERROR table.

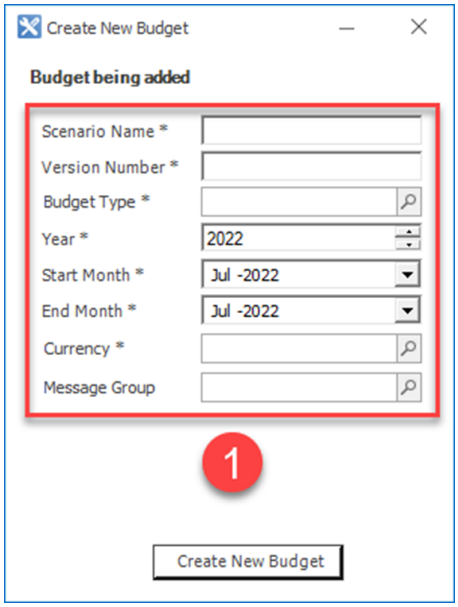

1. The number of retries can be seen in the new **Retries** column of the Budget System Task form.

Budget Calculation Robustness

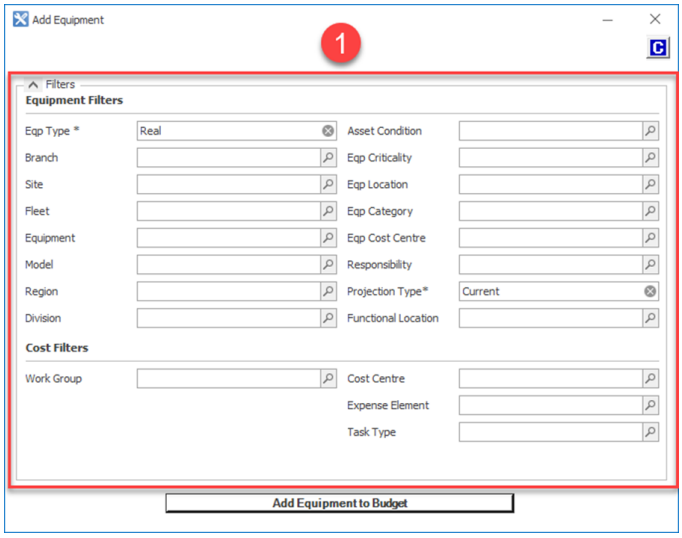

The budget calculation process has been enhanced to improve the robustness of the process.

Budget & Forecast Manager > Create New Budget

1. **STO** and **Project Code** have been removed from the **Create New Budget** screen.

Budget Header Manager > Add Equipment

1. **STO** has been removed from the **Add Equipment** > **Equipment Filters** section.

Timesheets

Work Order Timesheet Restriction

AMT users can be configured with access to equipment in specific sites or branches, or access to all equipment in all sites. In previous versions, when a user was configured with restricted access to sites or branches, this restriction was not applied to the timesheet function. Consequently, the timesheet function in AMT returned work orders in the timesheet grid for sites the user did not necessarily have access to. Users could also search for, and add new work orders to the timesheet, and this search function also displayed work orders for sites the user did not have access to. This allows users to incorrectly record time against work orders in sites where they don't work.

In AMT 8.23 U1, the timesheet feature has been enhanced to only show work orders associated with sites the user has access to.

Fixes

Functional Area	Fix	Work Item
Budgeting	Fixed an issue where filtering in the budget and forecast manager would not return the expected results when the AMT setting **MAX_RECORD** was set to **0**.	45404
	Fixed an issue where under some circumstances it was not possible to delete budgets via the **Budget and Forecast Manager**.	46453
	Fixed an issue where the **Budget Summary** report could show **0** for some values. This was due to the report looking at the incorrect **Cost Bearer**.	46214
	Fixed an issue where failed budget system tasks were not retried. In this release, a failed budget system task is retried three times before being reported as a failure.	47015
	Fixed an issue in the **Budget** and **Forecast Manager Cost Occurrence** screen where not all costs would be shown if the AMT setting **MAX_ RECORD** was set to **0**.	47109
	Improved the content of the informational message displayed when a budget is deleted.	45832
	Fixed an issue where the **BUDGET_ERROR** table was not populated with all details when a budget was deleted using the **Budget and Forecast Manager**.	46760
Builder G3	Fixed an issue where values for **Parts and Labour** could be multiplied by 100 when importing Standard Jobs. This only occurred when the number format of the parts and labour values in the import file were different from the number format defined in the Windows operating system.	43816
Planning	Fixed an issue where the **Long-Term Planning | Edit Next Due** screen could be truncated when viewed on a display resolution of 1366 x 768 pixels.	44298
Component Changeout Grid	Fixed an issue where **Sales Status** information could not be updated in the **Component Changeout Grid**. This issue only occurred under specific data conditions.	46186

Functional Area	Fix	Work Item
Data Models	Fixed an issue in the **BudgetVsActualDataModel.BudgetLabourHours** data model where Budget Labour Hours outside the budget period were being erroneously included.	46119
	Improved the performance of the **StrategyTaskDataModel.StrategyTask** data model. To improve performance, supporting data is now pre-generated using a new System Task, **Refresh Projection Report Tables**. This system task refreshes data used by the StrategyTaskDataModel.StrategyTask data model every 30 minutes.	45002
	Fixed an issue where the **OccType** field in the **WorkorderDataModel.ParentWorkorderSettlement** data model would always be returned with a null value.	45687
	Added new column, **ExpenseElementKey**, to the **OccurrenceDataModel.FutureOccurrence** data model.	48456
DLCC	Fixed an issue where suppression strategy tasks in alternate projections were not suppressing correctly.	43764
	Fixed an issue where future occurrences may not be calculated correctly in alternate projections.	43764
	Fixed an issue where the DLCC would unnecessarily re-calculate projections.	44296
	Fixed an issue where a projection's last occurrence value may not be recalculated after the **Next Due** value is updated.	46394
	Fixed an issue where the DLCC would incorrectly quarantine projections if a settlement was imported for a date-based task.	44277
	Fixed an issue where DLCC would continually cycle through some current projections, changing the calculation status from **Required** -> **Calculating** -> **Required** -> **Calculating**.	44296
	Fixed an issue where the DLCC and the **SQL Server CDC SQL Agent Job** could deadlock each other.	42544
	Fixed an issue where the DLCC would stop maintaining a strategy task risk rating if the strategy task was changed to be not system calculated.	43365

Functional Area	Fix	Work Item
Employees	Fixed an issue where employee records could not be deleted.	44776
	Fixed an issue where it was not possible to update an Employee's **Workgroup** or **Labour Activities** for a given Site.	46752
	Improved the usability of the **Employee** editor.	44967
	Fixed an issue on the **Equipment** editor task tab where an exception would occur when filtering for all **Work Groups** except inactive **Work Groups**.	45462
	Fixed an issue where equipment external identifiers could be duplicated among equipment in projections other than the current projection.	44760
	Fixed an error where tooltips were not popping up on the **Equipment Editor** form.	46131
Expense Elements	Due to severe performance issues with large databases, the **Standard Job Audit Log** is now disabled by default. It may be re-enabled once sites have confirmed performance.	42524
Long Term Planning	Fixed an issue where choosing **Set Next Scheduled Date** in the **Long-term Planning Advanced** grid was causing an exception.	47185
	Improved the load times of the **Long-Term Planning** screen.	47185
Mobile	Fixed an issue where selecting an inspection was causing an exception.	48544
	Fixed an issue where notifications would not appear if the **To** date range was the last day of a month.	44813
	Fixed an issue where an exception could occur if the mobile sync process attempted to update more than one geolocation record in a single sync.	47102
	Fixed an issue where offline inspections in AMT Mobile were missing **Performed by** employee details.	48514

Functional Area	Fix	Work Item
Planning	Fixed several issues when creating work orders from Strategy Tasks relating to **Criticality**, **Risk**, **Requires STO**, **Can Move** and **Tolerance**: 1. When a work order is created from a strategy task automatically, Values for **RequireSTO**, **Can Move** and **Tolerance** are now copied to the work order. 2. Criticality no longer becomes null in the work order 3. Criticality and STO no longer become null in workorder when the event is unassigned.	49037
	Fixed an issue in the **Planning | Scheduling** tab where an exception would occur if a filter was applied that included a **Group By** specifier.	46181
	Fixed an issue where the **Planning Group** was not copied from a strategy task when a work order was being created through the **Update planning from strategy task** system task.	46719

Functional Area	Fix	Work Item
Reports	Fixed an issue in the **Overdue Strategy Task Report** where specifying an STO filter would result in an exception.	44812
	Fixed several issues in the **Capital Forecast Report**, **Equipment Details Report** and the related **Equipment Editor**: Not all equipment was being displayed when grouping by Fleet and Model. 1. Renamed the **Replaces Equipment** column to **Replaced by Equipment** on the **Equipment Editor**. 2. Renamed the **Replace** column to **Replaced By** on **Capital Forecast** and **Equipment Details** report.	45680
	Fixed an issue in the **Equipment Evaluation Report** where the **Cumulative UOM** and **Cumulative Costs** rows would overlap.	42149
	Fixed an issue where **Equipment Operational Performance Summary Report** was showing negative value in the **Availability** column.	44366
	Fixed an issue where the **Hours to PM** report would sometimes timeout before any data could be returned.	48728
	Fixed an issue in the **MARC PCV Chart Report** that was causing incorrect future and total billing values to be displayed.	26103
	Fixed issue in the **MTBF Report** by extending the length of grouping text to accommodate larger names.	41876
	Fixed an issue where the **Timesheet Cost Analysis Report** could timeout before returning any data.	48782
	Fixed an issue in the **AMT to GL Reconciliation Report** where it was impossible to select a site if a branch was selected.	44942
	Fixed an issue so that **Unassigned Cost Analysis Report** only calculate current projection.	36084
	Fixed an issue in **Unassigned Cost Analysis** report where selecting site filter after branch was throwing an error.	46338
	Script to enable PLESN report was updated to exclude search control type section since they are part of standard AMT deployment script.	33215

Functional Area	Fix	Work Item
Sales History	Fix the issue that **Sales History** is incorrectly added even if PSM is disabled.	45752
Service Schedule Sequencing	Fixed the issue that caused sometimes next occurrence in sibling suppression group to be incorrect.	48412
Siblings Mode	Fixed an issue to make sure copied equipment should retain the parent asset only if the new asset is of the same type as the asset it was copied from.	47597
Strategy Task	Fixed an issue on **Job Details** fields tab order. The tab order should be sequential i.e from left to right or top to bottom.	41572
	Fixed an issue so that Job cost import raises error if import message has different delete flags for cost allocation reference.	49028
	Fixed an issue to prevent AMT from manually setting next occurrence to system calculated for the scheduling groups with one strategy task in a group.	46537
	Fixed an issue so that newly created strategy task from Standard jobs will now have the description copied from the **Std Job** up to 97 characters.	36697
	Fixed an issue so that Strategy Task import and Standard job import do not link strategy tasks to standard jobs.	46224

Functional Area	Fix	Work Item
Workorder	Fixed an issue that on **Edit Workorder** screen, the work order number that displays could not be copied and pasted which hampered productivity.	47365
	Made UI design changes to make sure that the **New Workorder** screen doesn't cut off in lower resolution screens.	45010
	Fixed an issue to make sure work order status changes to **YTS/O/A**, **Actual Duration**, **Actual Offset**, and **Actual Start Time** will be reset.	46069
	Fixed an issue where **POCreation** failed when clicking the **Create ERP WO** button on planning tab in **PO Mode** and when **Choose_WO_Date** is on.	46682
	Fixed an issue where a proper access level (especially **View**) is not passed to the **Edit Workorder Settlement** screen. This includes open **Edit Workorder Settlement** screen from both **Workorder Settlement Manager** screen and **Create Component Changeout Journal** screen.	44319
	Fixed an issue to stop work order **Settlement Manager** from throwing exception when user try to add technical detail.	48899
	Fix the issue that operations are duplicated when creating **Workorder** from **Strategy Task**	46196
	Fixed an issue where **Add STD Job/Technical Advice** screen were throwing an error on load.	48976
	Fixed a problem where work orders were not getting sorted properly in the workplan2 report.	46317

Version Number 8.23

The following is a list of all changes and updates addressed in AMT Version 8.23.

Overview

AMT v8.23 has some transformational changes across the areas of Long-term Planning, Budgeting & Forecasting, DLCC calculation and performance. AMT v8.23 includes all changes made since the release of AMT v8.21, which includes changes made in the controlled release version AMT v8.22. The following release notes document itemises these changes which should be discussed with AMT consultants as part of any upgrade process.

New Features

Single Sign On

Background

Previous versions of AMT have not supported Single Sign On and customer demand has driven the lack of this capability to be addressed.

From AMT 8.22, AMT can automatically use the windows login credentials to validate a user's ability to access the AMT Windows client provided they use an in-house Active Directory. Azure Active Directory is not supported.

Enhancements

1. Single Sign On is controlled by dbo.AMT_FEATURE (Feature_ID = 38).
2. New System Task called **Sync Active Directory Domain Users**.
3. New **AD_Domain** table.
    a. For each active directory domain, create a record in the AD_Domain table.
        i. DomainName (mandatory).
        ii. Username (optional).
        iii. Password (optional).

        System Task uses this user, or Service Account (if username and password are empty), to synchronise the domain user.

Configuration

1. Enable the **Single Sign On** feature.
2. Set Sync Active Directory Domain Users to Auto-Run.

    ```
    [dbo.AMT_SYSTEM_TASK].[Is_Auto_Run] = 1
    ```

    After the System Task runs, domain users are created automatically in the AMT_USER table.

Users then log in automatically to AMT, which uses their windows domain username. They will no longer see the dialog box that prompts for a username and password.

An **Authentication Failed** dialog box may be received when the following occurs:

3. No record exists in AD_DOMAIN equivalent to the user's domain.
4. The Service Account (used to start the AMT Calculation and Interface services) doesn't belong to the domain or the two domains are not trusted.

5. The Username/Password provided in AD_DOMAIN is not correct or the password is not encrypted.
    - A Password Encryption Converting Tool is provided as part of the AMT Upgrade process.
6. The Domain Controller is not accessible.
    - The User's account has expired in Active Directory.
7. The User's account is inactive in Active Directory.

Set up and Admin > Equipment

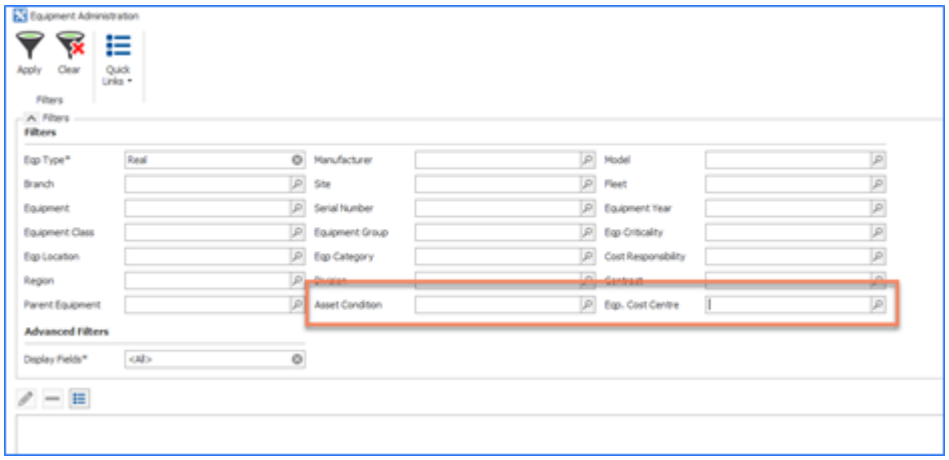

Equipment Administration Search screen - New Search Filters, Filter Cascading and additional Display Fields

New search filters have been added to **Equipment Administration**.

- Asset Condition (single select).
- Equipment Cost Centre (multi-select).

Filters that cascade mean if a Site or Model filter is included, the **Equipment Cost Centre** filters displayed are only those cost centres recorded against Equipment for the site or models selected. If no site or model is selected, all cost centres that have been associated with any equipment in the database will display in a drop-down list.

Any new attributes added as part of this release (for example, Asset Condition) have been added to Display Fields where appropriate.

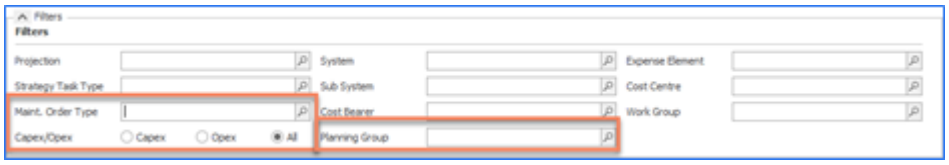

Edit Equipment Tasks tab - New Search Filters

New search filters have been added to the **Edit Equipment** > **Tasks** tab.

- Maintenance Order Type (multi-select).
- Capex / Opex (radio button).
- Planning Group (multi-select).

These filters do not cascade depending on the selection on this screen. This is a by design different behaviour from that which has been introduced as new functionality included in AMT in this release. This screen remains with the previous filter behaviours; therefore, it is possible to include a code as a filter and return no results in this screen because that code is not found on any of the records.

Edit Equipment - New fields

New fields have been added to **Equipment**:

- **Asset Condition** (added to **Basic** section, **Classifications** Tab) (see Risk Management).
- **Requires STO** (added to **Basic** section, **Classifications** Tab) (see Shutdown, Turnaround, Outage).

Set up and Admin > Projections

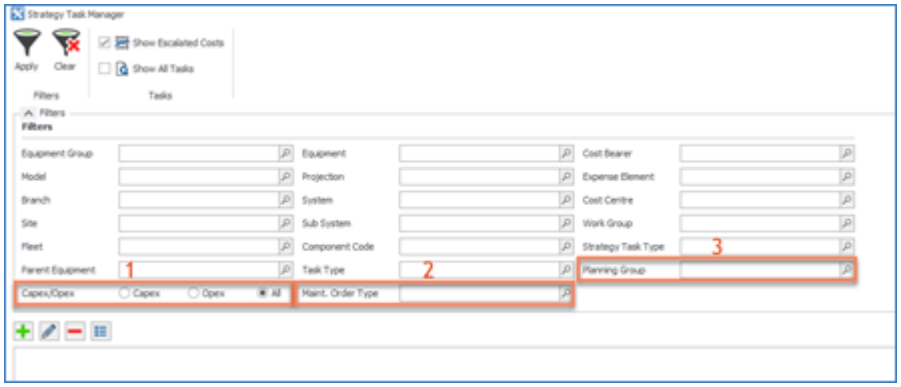

Strategy Task - New fields

New fields have been added to the Strategy Task:

- **Capex Flag** (added to **Depreciation** section, **Base Details** tab).
- **Maintenance Order Type** (added to **Misc** section, **Base Details** tab).
- **Planning Group** (added to **Misc** section, **Base Details** tab).
- **Requires STO** Flag (added to **new Shutdown, Turnaround, Outage (STO)** section, **Base Details** tab).
- **Can Move** Flag (added to **new Shutdown, Turnaround, Outage (STO)** section, **Base Details** tab).
- **Move Tolerance** (added to **new Shutdown, Turnaround, Outage (STO)** section, **Base Details** tab).

Strategy Task Manager screen - Modified

Menu Location: **Setup & Administration** > **Projections** > **Strategy Task Manager**.

Added filters and columns in the grid:

1. Capex/Opex.
2. Maintenance Order Type (multi-select).
3. Planning Group (multi-select).

Strategy Task

CapEx Flag

Background

A CapEx flag has been added to the strategy task to allow organisations to understand and manage their strategy funding, particularly when reviewing budget and forecast information.

If the flag is selected, the strategy task is CapEx or capital funded. If not selected, the funding is considered an OpEx or operating expense.

Enhancements

New field (**IsCapEx**) added to **dbo.tblProjTasks**.

The CapEx flag can be manually set on the Strategy Task individually or updated using a multi-editor.

Multi-Editors updated with the CapEx flag are:

- Multi-Task Editor (**Setup & Admin** > **Projections** > **Multi-Editors**).
- Multi-Task Editor (**Centrelines** > **Administration**).
- Multi-Task Editor (**Modelling** > **Administration** > **Projections**).

For customers who use AMT Depreciable Assets, if the strategy task has a linked FFDST (Future Forecast Depreciation Strategy Task) the CapEx flag is selected and read only. The logic behind this being that a depreciable asset is one that is capital in nature and accounting rules do not allow an item that is depreciated to also be an operating expense.

Screens and grids updated

- Strategy Task Manager.
- Editable Strategy Task Manager.
- Strategy Task Analyser.
- Long-term Planning Advanced.
- Component Changeout Grid.
- Overhead Cost Category.
- Copy Strategy Tasks.
- Add/Copy/Delete Projection.
- Equipment Editor.
- Budget & Forecast Manager.
    - Cost Occurrence Manager
        - Filter added.
        - Column added to display result in grid.
    - Labour Hours Manager.
        - Filter added.
        - Column added to display result in grid.
    - Overheads Editor
        - Filter added.
        - Column added to display result in grid.

Reports

- Projection Summary.
    - Filter added in Additional Filters section.
- Projection and Interval Analysis.
    - Filter added.
    - Filter added in Additional Filters section.

Strategy Task

Maintenance Order Type (MOT), Planning Group and Regulatory Code

Enhancements

New fields, **MOTId**, **PlanningGroupId** and **RegulatoryId** have been added to **dbo.tblProjTasks**.

MOT, Planning Group and Regulatory Code can be manually set on the Strategy Task individually or updated using a multi-editor.

Multi-Editors updated with MOT, Planning Group and Regulatory are:

- Multi-Task Editor (**Setup & Admin** > **Projections** > **Multi Editors**).
- Multi-Task Editor (**Centrelines** > **Administration**).
- Mult-Task Editor (**Modelling** > **Administration** > **Projections**),

Screens and Grids updated

  - Column added to display result in grid.

Reports updated

- Projection Summary (filter added in Additional Filters section).*
- Projection and Interval Analysis (filter added in Additional Filters section).*

* Regulatory code not added here.

Depreciable Asset Recognition

New Negative Revaluation

Menu Location: **Setup & Admin** > **Depreciable Asset Recognition** > **Depreciable Asset Manager**.

Background

Historically, AMT did now allow a negative value to be entered during the revaluation process. This was because Impairments are considered to be negative valuations. However, this was not appropriate when customers needed to reverse a positive revaluation that had been incorrectly processed or adjust take-on balances between two component assets.

Enhancement

AMT allows a negative value to be entered when undertaking a revaluation using either **Revalue Asset** in the **Quick Links** menu, or right-mouse click, open in the grid.

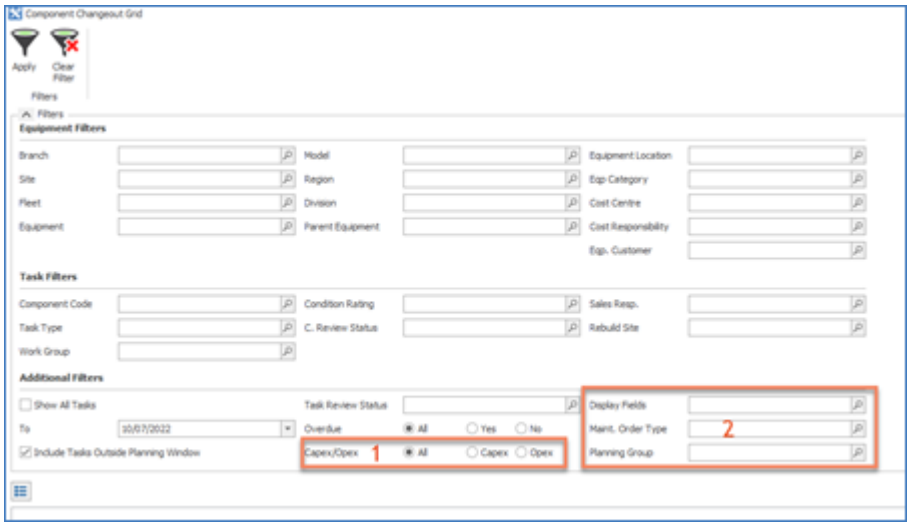

AMT will check that any negative value entered does not adversely impact the closing written down value of the asset. The closing written down value of an asset cannot be less than zero. A message will display to the user if the written down value is violated – *The entered Revaluation amount causes the Written Down Value (WDV) to be negative*.

Long-term Planning

Modified - Component Changeout Grid - New Filters

New filters and additional display fields have been added to the Component Changeout Grid.

Menu Location: **Long-term Planning** > **Component Changeout Grid**

1. Added Capex/Opex filter (default is All).
2. Added new filters and display fields:
    a. Display Fields.
        i. Asset Condition.
        ii. Asset Condition Description.
        iii. Capex.
        iv. Condition Rating.
        v. Equipment Criticality.
        vi. Equipment Criticality Description.
        vii. Operational Criticality.
        viii. Planning Group Code.
        ix. Planning Group Description.
    b. Maintenance Order Type (multi-select).

c. Planning Group (multi-select).

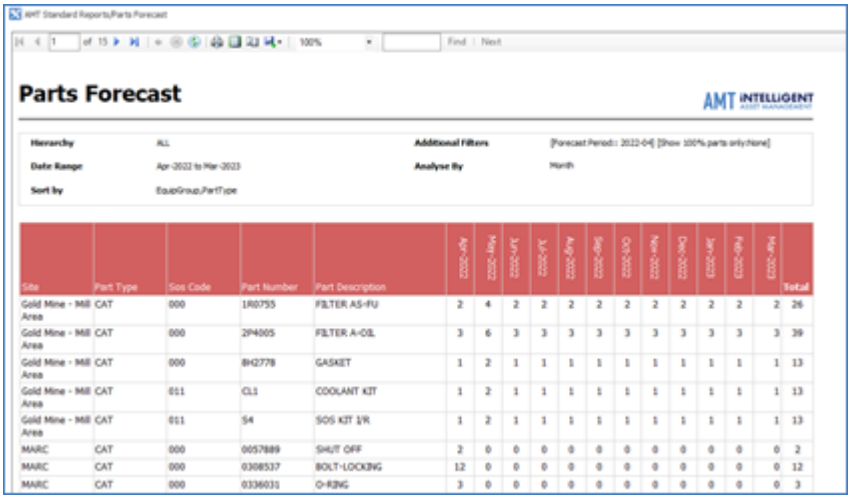

Display Fields list is in alphabetical order.

Updated - Parts Forecast report

Menu Location: **Long-term Planning** > **Parts**

The **Parts Forecast** report has been migrated from Crystal to SSRS.

- **Sort By** displays the values of the selected sort criteria.
- **Forecast Period** displays in **MMM-YYYY** format.

Updated - Next Occ Export and Next Occ Import

The **Import/Export** processes for Next Occurrence have been updated to support Cyrillic.

Risk Management

Background

Historically, AMT has included facets of risk management within its approach to risk management. However, AMT has not, until now, provided a focused, results-oriented and auditable risk management solution that is easily understood and manageable.

Risk is not an isolated attribute but is, quite naturally, a combination of several risk factors that come together to give an overall assessment of risk and impact.

In long term planning and budgeting, AMT now calculates a raw **Risk Rating** value for every strategy task. It is the result of multiplying risk ratings held against three attributes. These attributes are **Equipment Criticality**, **Asset Condition** and **Operational Criticality**.

Equipment Criticality and Operational Criticality are existing attributes whose system table has been enhanced and are now shown in the User Interface. Asset Condition is a new attribute.

Each code in each table should be given an associated risk rating which will allow the multiplication of three attributes for an overall rating. This overall rating is then normalised and 'ranked' or grouped to nominate the risk.

Default settings can be configured for these attributes to support ease of data creation and any strategic future changes that may require codes to be made inactive to prevent future use. Inactive codes supports data integrity. These tables are supported by audit capability that ensures any changes made can be appropriately audited.

Enablement

To enable risk calculations in AMT, all the underlying tables must be configured and the relevant codes added to the asset and strategy task records.

1. Configure the **Equipment Criticality** system table (see Updated Equipment Criticality system table).
    - Include the **Ratings** for each active code.
2. Configure the **Asset Condition** system table (see New Asset Condition system table).
    - Include the **Ratings** for each active code.
3. Configure the **Operational Criticality** system table (see Updated Operational Criticality system table).
    - Include the **Ratings** for each active code.
4. Configure the **Risk Grouping** system table (see New Risk Grouping system table).
    - Include the **Ratings** for each active code.
5. Update the **Equipment Master Data** with the Equipment Criticality and Asset Condition codes.
6. Update the **Strategy Task Master Data** with Operational Criticality codes.

The absence of any one code, or an associated rating against any one code, prohibits a risk calculation for that strategy task. If the Risk Grouping system table is not configured, this results in a single group without a description.

Enhancements

Screens and multi-editors have been updated to support the new fields.

Long-term Planning and Long-term Planning Advanced have been updated to display additional columns. The Risk Rating value calculated by AMT will display in a single column together with the risk grouping description. The user is then provided with an additional column that allows them to include a risk grouping code, (selected from a drop-down list), if the calculated description needs to be upgraded or downgraded.

The **Calculated Risk Rating** and any risk ratings that have been overridden will display in budgeting screens – **Cost Occurrence Manager** (Equipment Costs) and **Labour Hours Manager**. In the budget screen, the override value can once again be updated, if necessary, in the budget snapshot. This override will update the risk grouping code in the budget snapshot only; it does not retrospectively update the value for Risk Rating Override that displays in Long-term Planning and Long-term Planning Advanced.

How the Risk Grouping works

The risk grouping supports the calculated risk being normalised to a value between 1 and 100.

If the Equipment Criticality ranking has a range of 1 to 4, Asset Condition a range of 1 to 6 and Operational Criticality a range of 1 to 5, the resultant maximum calculated risk value would be 120.

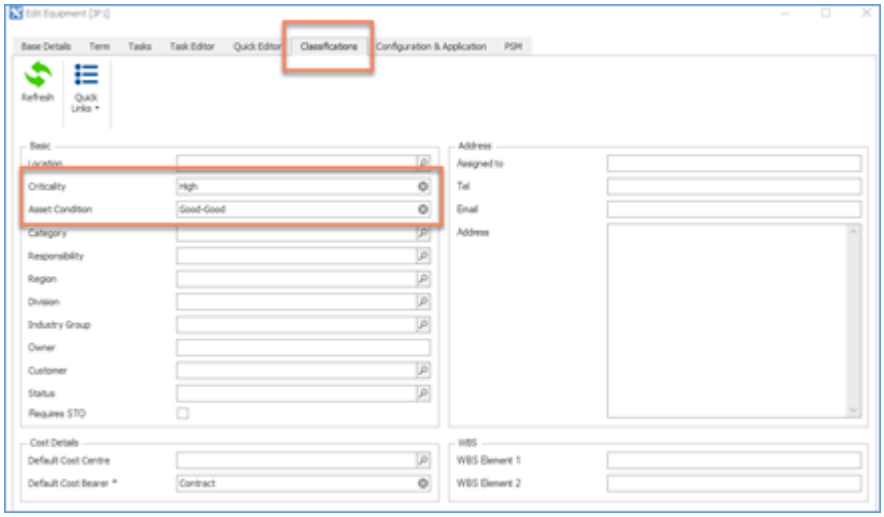

Or Equipment Criticality could be 1 to 5, Asset Condition 1 to 10 and Operational Criticality 1 to 5 resulting in 250.

Being able to determine the ranking, and to provide flexibility for customers to determine what may constitute the risk profile, normalising the calculated value allows bands to be configured to suit each customers demands is achieved.

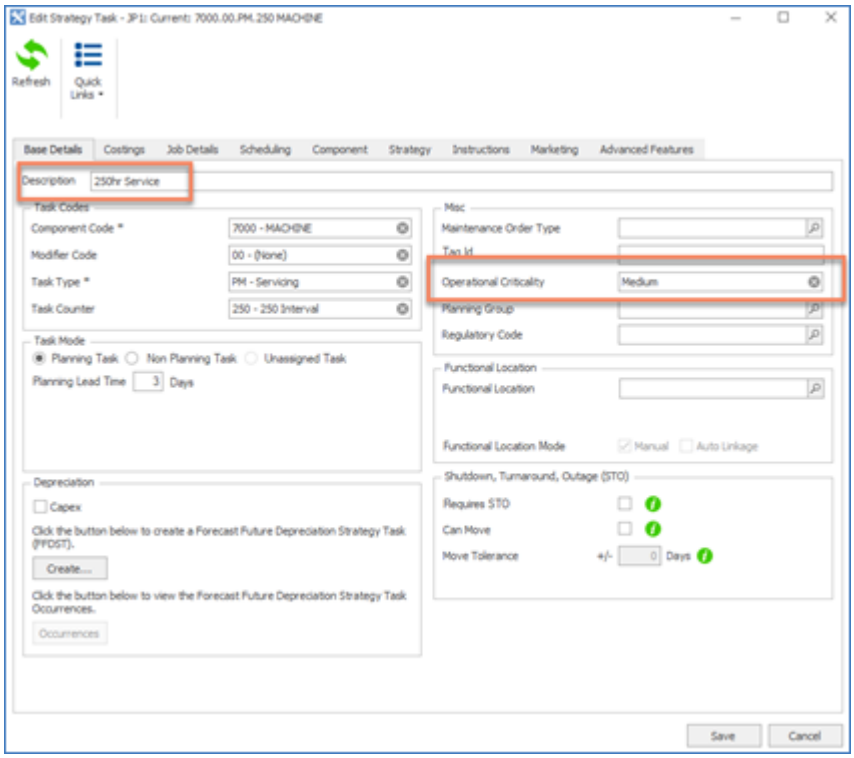

When implementing risk, the customer needs to review and work through some examples to ensure their final risk profile is what they expect and need for their business.

Worked example

An asset has a current Asset Condition = Good and Equipment Criticality = High.

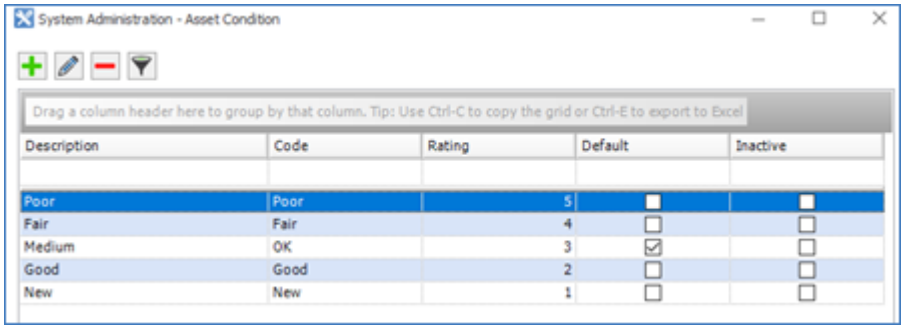

Three strategy tasks have been created for Engine Changeout (Operational Criticality = Critical), 250 Hr Service (Operational Criticality = Medium) and 1000 Hr Service (Operational Criticality = High).

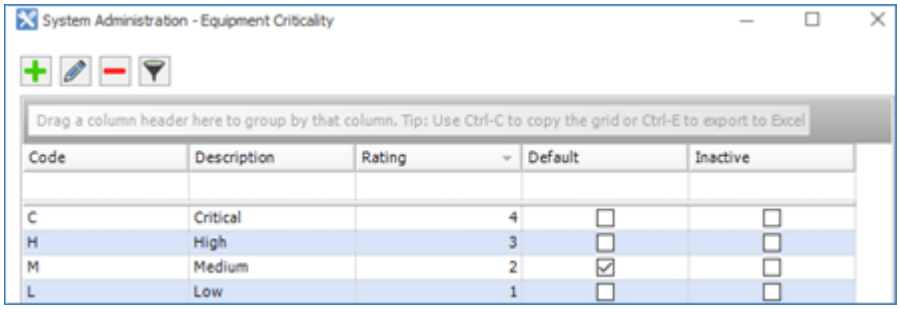

The underlying system tables have been configured as follows.

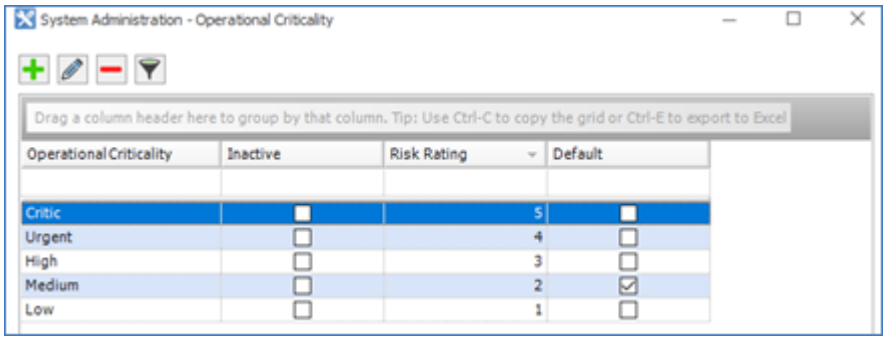

Asset Condition

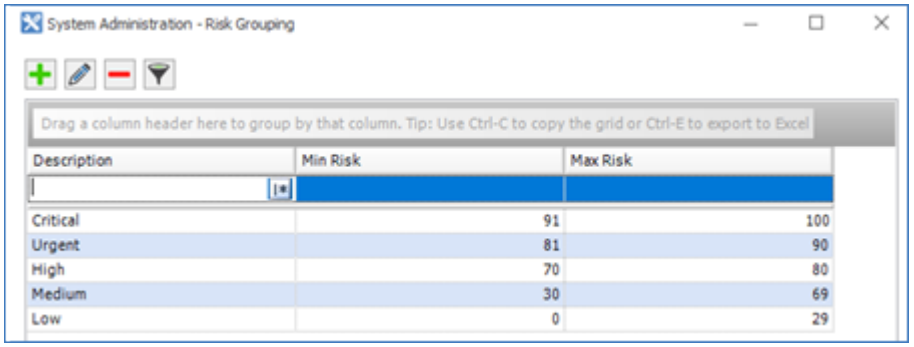

Equipment Criticality

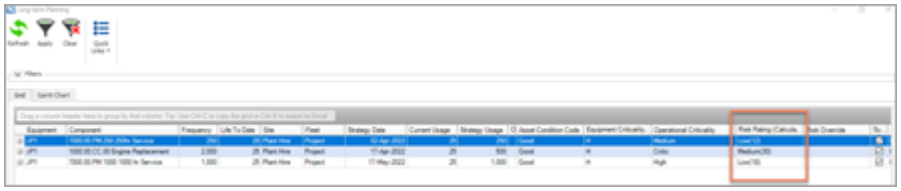

Operational Criticality

Risk Grouping

The resulting risk calculation for each of these three tasks can be seen in Long-term Planning and Long-term Planning Advanced.

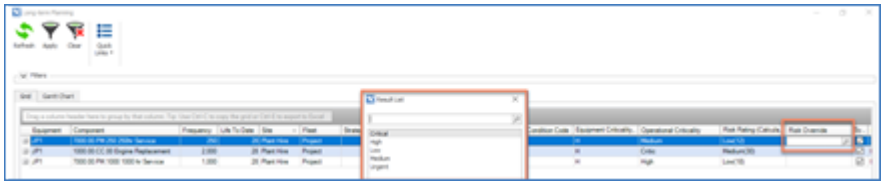

Visually, AMT displays both the normalised value calculated (in brackets) together with the risk group in which it falls.

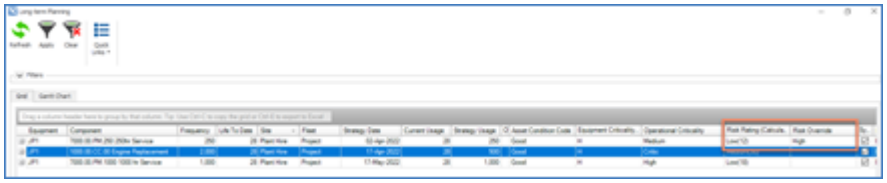

Task	Risk Calculation	Risk Rating Displayed
Engine Replacement	2 * 3 * 5	Medium (30)
250 Hr Service	2 * 3 * 2	Low (12)
1000 Hr Service	2 * 3 * 3	Low (18)

Note that, in this example, the calculated value is also the ‘normalised’ value because the rankings of Equipment Criticality, Asset Condition and Operational Criticality are 4, 5, and 5 respectively which equates to 100 being the maximum calculation.

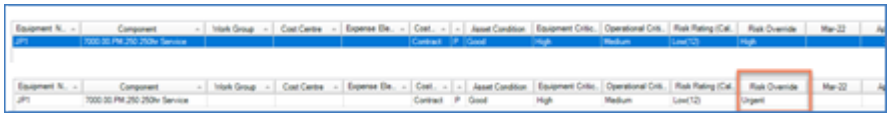

Also available in Long-term Planning and Long-term Planning Advanced is a **Risk Override** column. The purpose of the Risk Override column is to allow the planner to modify the system calculated risk rating at their discretion.

In the above example, the **250 Hr Service** risk has been overwritten to **High**.

When a budget is created, it will take all the value for risk and allow the risk override to be overwritten there from a budgetary perspective. This is, once again, a discretionary update and will not modify the risk override back on the underlying strategy task. If the underlying strategy task needed to be updated, the planner would modify the Risk Override in Long-term Planning or Long-term Planning Advanced.

In the above example, the budget risk has been increased to **Urgent**. This would indicate if budgetary cuts were to be made, this strategy line is determined to be of greater importance to the business.

New screen - Long-term Planning Advanced

Menu Location: **Long-term Planning**

Background

The existing Long-term Planning Grid and Gantt view visualises future occurrences of planning strategy tasks only.

These occurrences can be moved and modified by the long-term planner; however, there is no visualisation that the occurrences may require, or may already be part of, a Shutdown, Turnaround or Outage (STO).

This screen enables planners to manage their work and include references to STOs. The screen supports movement and confirmation of strategy task occurrences, visualisation of overdue occurrences and the visualisation of work to be performed during STO periods.

Any work that is required to be performed during a shutdown but has not been assigned to a specific shutdown is visible.

A planner can add work to a shutdown. They can also manage and shift shutdowns and associated work subject to the defined STO rules that cover constraints and tolerances.

Enhancements

- Created a new Long-term Planning Advanced screen with grid and Gantt strategy task occurrence visualisation for both planning occurrences and non-planning occurrences.
- Includes STO visibility.
- Work that must be performed in a shutdown is displayed in bold text.
- Allocates and displays the STO number against work included in the shutdown.
- Work included in a shutdown that does not necessarily need to be performed during a shutdown period will not display in bold.

Enablement

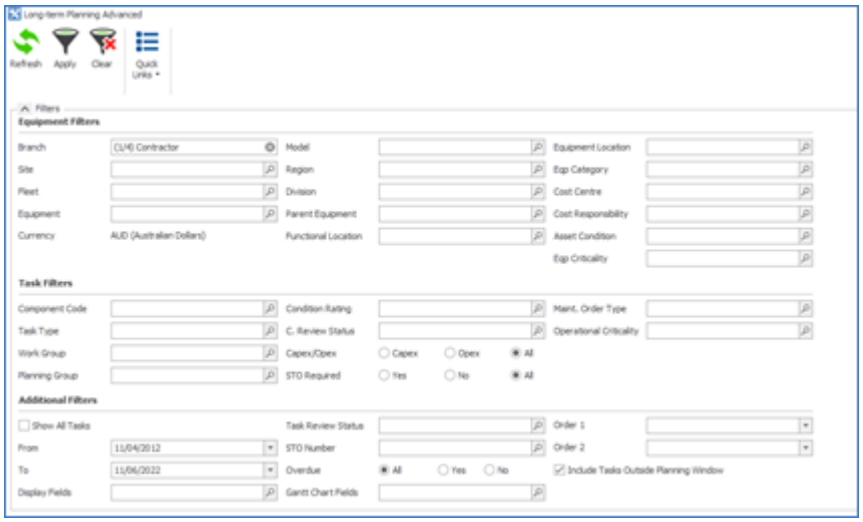

Availability of the Long-term Planning Advanced menu item is controlled by **dbo.AMT_FEATURE**.

- Feature_ID = 36 (Long-term Planning Advanced).
    - Long Wall Mining (Feature_ID = 32) must be disabled (= 0).
    - Defined Maintenance Period (Feature_ID = 37) must be disabled (= 0).

Business Rules

- If the **Requires STO** flag is enabled, the **Strategy Task** and **Occurrences** will be in bold text.
- If **Next** and **Future Occurrences** have been included in an STO, the occurrence will have a weighted line around the bar on the Gantt. The STO number will display.
- An occurrence that does not have the STO flag enabled but has been included in an STO will not be in bold text, but will have a weighted line around the Gantt bar and an STO number.
- **Scheduling Groups** are NOT supported in AMT v8.23.

Long-term Planning Advanced Search Filters

The search filters are fundamentally the same as the Long-term Planning but there are some differences. **The expectation should not be that these screen filters and display are the same**.

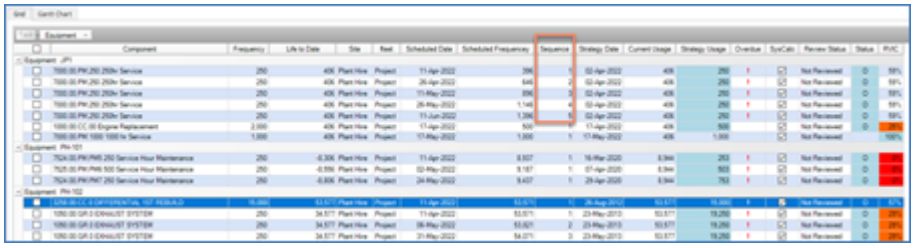

Long-term Planning Advanced includes filters notably for the following:

- **STO Required** (in Task Filters).
    - Retrieves strategy tasks based on filter.
- **STO Number** (in Additonal Filters) - multi-select.
    - Retrieves occurrences that match the nominated STOs.
- **Gantt Chart Fields** (in Additional Filters).
    - Supports the optional inclusion of **Asset Condition**, **Risk Rating (calculated)** and **Risk Override** into the grid display in the Gantt tab.

Long-term Planning Advanced Grid View

The grid view lists individual occurrences (sequence number = occurrence number) for all strategy tasks matching the filter criteria.

The grid offers an option to multi-select line items and perform next action. The actions will vary depending on whether a single line or multiple lines are selected.

Further actions available when a single grid line is selected:

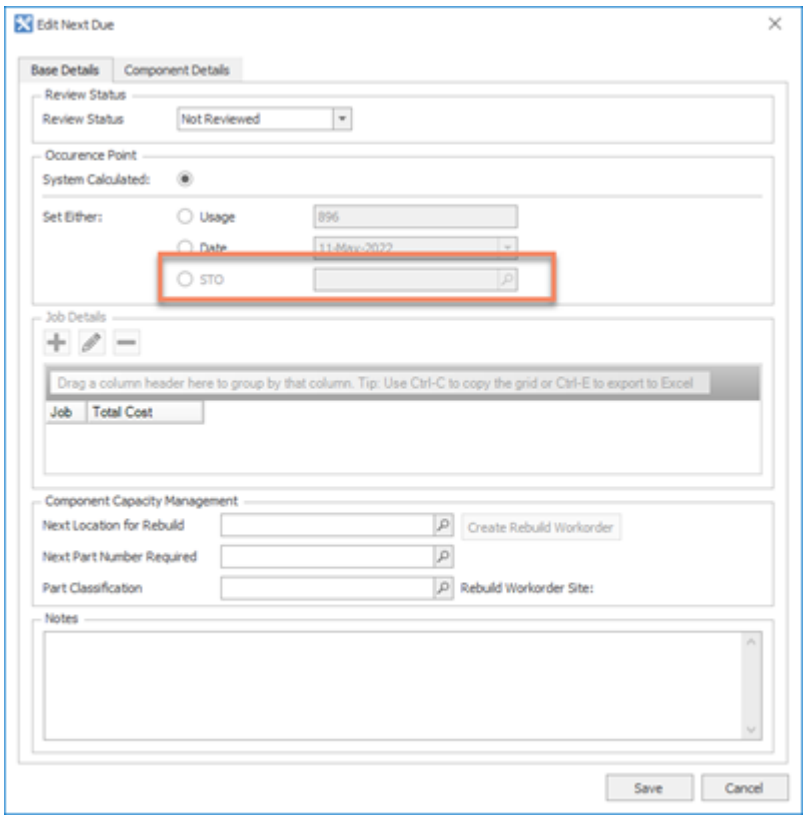

- Select/Deselect All.
- Edit Next Due.
- Updated Last Occurrence.
- Set Next Scheduled Date.
- Utilisation Analyser.
- Assign/Unassign STO Number.
- Usage Profile.
- Actual Usage.

Edit Next Due screen

The **Edit Next Due** screen has been updated to include **STO Number** assignment. Business rules will apply when an STO Number is allocated. AMT will look at the dates and tolerances associated with the occurrence to

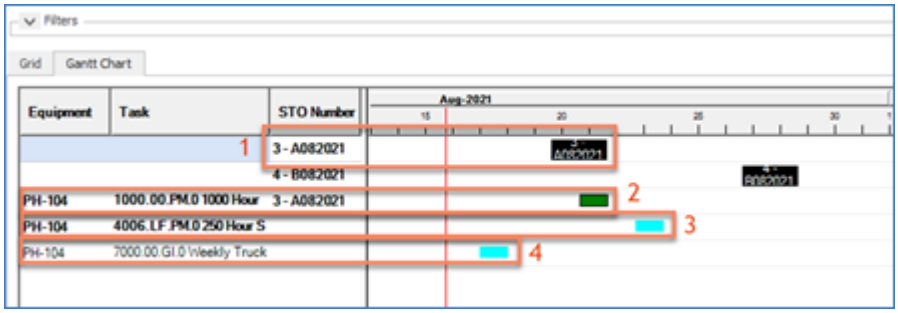

determine if it falls within the STO date range and whether the previous occurrences of the strategy task have been assigned to an STO if this occurrence is not the first.

Messages will be given to the user.

Long-term Planning Advanced Gantt view

The Gantt view shows the strategy task as a single line, but will visualise each occurrence independently on the Gantt chart.

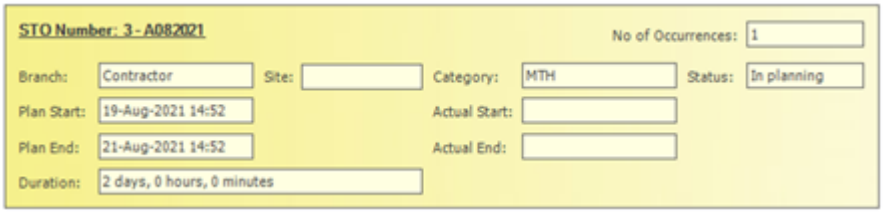

1. Identifies the STOs in the date range.
2. Identifies the occurrence in the date range; this occurrence:

a. **Requires STO** flag enabled - shows in bold text.

b. has been allocated to an STO - highlighted perimeter around the Gantt bar and STO number displays.

3. Identifies occurrence in the date range with STO enabled (bold) and no STO Number allocated (Gantt has no highlighted perimeter), no STO number displayed.
4. Identifies occurrence in the date range with STO not enabled and no STO Number allocated.

Hovering over the STO bar displays additional STO details in a display window.

- STO Number.
- Number of occurrences included in the STO.
- Branch to which the STO belongs.
- Site (optional) to which the STO belongs.
- STO Category.
- STO Status.
- Plan Start and End Date and Time.
- Actual Start and End Date and Time.
- Duration.

Right-mouse clicking on the STO number and selecting **Highlight Linked Occurrences** will display all occurrences within the Gantt that have been added to the STO. This is useful when the STO contains occurrences that are linked but the number of occurrences linked are more than will fit in the display area.

Hovering over the occurrence bar displays additional occurrence details in a display window.

- Strategy Task identification.
- Sequence Number = Occurrence Number.
- Duration.
- Next Date.
- Next Usage.
- Frequency.
- Locked.
- Occurrence Date.

- Occurrence Usage.
- Life Used.
- Equipment Criticality.
- Asset Condition.
- Operational Criticality.
- Capex Flag.
- Calculated Risk.
- Maintenance Order Type.
- STO Number.
- Planning Group.
- Comment.

Next Due and the Gantt chart support the assignment of dates and movements, and these are governed by the configuration on the STO and the Strategy Task.

Given the number of rules that govern the STO Number assignment and the subsequent movements of either, or both of, the STO or Strategy Task Occurrence within Long-term Planning Advanced, your examples are best explained by AMT Product Management and the AMT Consulting team in a workshop.

Shutdown, Turnaround, Outage (STO)

Background

STO allows AMT to embark on the development of functionality that will support our customers, in this release, with a flexible business process for the management of STO within Long-term Planning. This development is the initial stage of the progressive introduction of additional functionality across the short to medium term planning timeframes.

An STO entity recognised in Long-term Planning Advanced will flow through to budget occurrences, therefore enabling customised report generation for any STO budget reporting requirements.

Prior to AMT v8.23, AMT had a database table (**dbo.SHUTDOWN**) that had been repurposed to support Longwall Mining. Some customers have enabled this feature in these prior versions in order to use the Defined Maintenance Period for Shutdown recognition purposes. However, the intended purpose of Defined Maintenance Period and the associated Longwall Mining functionality was not ideal long term to support shutdown management.

The process to migrate to STO capability from Defined Maintenance Period will need to be discussed with AMT Product Management and AMT Consulting teams prior to any transition.

Enhancements

Shutdown, Turnaround, Outage.

- Controlled by **dbo.AMT_FEATURE**.
    - Feature_ID = 36 (Long-term Planning Advanced).

New **Requires STO** attribute added to:

- Equipment [dbo].[tblEqpPlans].
- Standard Jobs [dbo].[tblStdJobs].
- Strategy Task [dbo].[tblProjTasks].

Audit logging when flag is changed on Equipment, Standard Job and Strategy Task.

Added **Requires STO** field to:

- Asset Adapter.
- Strategy Task Adapter.
- Standard Job Import.
- Standard Job Adapter.

New screen - STO Manager.

User Interface STO Category - which is a UI that sits over system table dbo.DMP_CATEGORY.

Configuration

In AMT_TYPED_VARIABLE, enable Long-term Planning Advanced (= 1).

- Long Wall Mining (Feature_ID = 32) must be disabled (= 0).
- Defined Maintenance Period (Feature_ID = 37) must be disabled (= 0).

AMT Technical Consultants can assist with changes to your AMT configuration on request.

Business process rules - Requires STO

The **Requires STO** flag identifies that the type of work, when performed, occurs during a defined shutdown period. This Requires STO flag for work can be driven based on the asset itself or the specific work that is to be performed. What this means is, AMT will support an asset being configured as Requires STO, which will mean that all work performed on that asset should be performed in an STO regardless of the type of work unless the strategy task is specifically modified to change the flag that defaults. Alternatively, it might be the type of work being performed that drives this work to be performed during a shutdown, whereas most other work performed on the asset does not need to be performed during a shutdown. The Requires STO is a flag which will be the default in AMT but can be overwritten.

1. If the asset has the Requires STO flag set to **Yes**, this will default to all strategy tasks that are created by AMT for this equipment.
    - On the strategy task, the Requires STO flag can be changed to **No**; an audit record will be written showing that it has been changed from the expected default.
    - Strategy tasks loaded via integration or import processes are assumed to have the flag set appropriately.
2. If the standard job has the Requires STO flag set to **Yes**, this will default to all strategy tasks that are created by AMT from this standard job.
    - On the strategy task, the Requires STO flag can be changed to **No**; an audit record will be written showing that it has been changed from the expected default.
    - Strategy tasks loaded via integration or import processes are assumed to have the flag set appropriately.

The following table provides a summary of the default outcomes for the Requires STO flag settings.

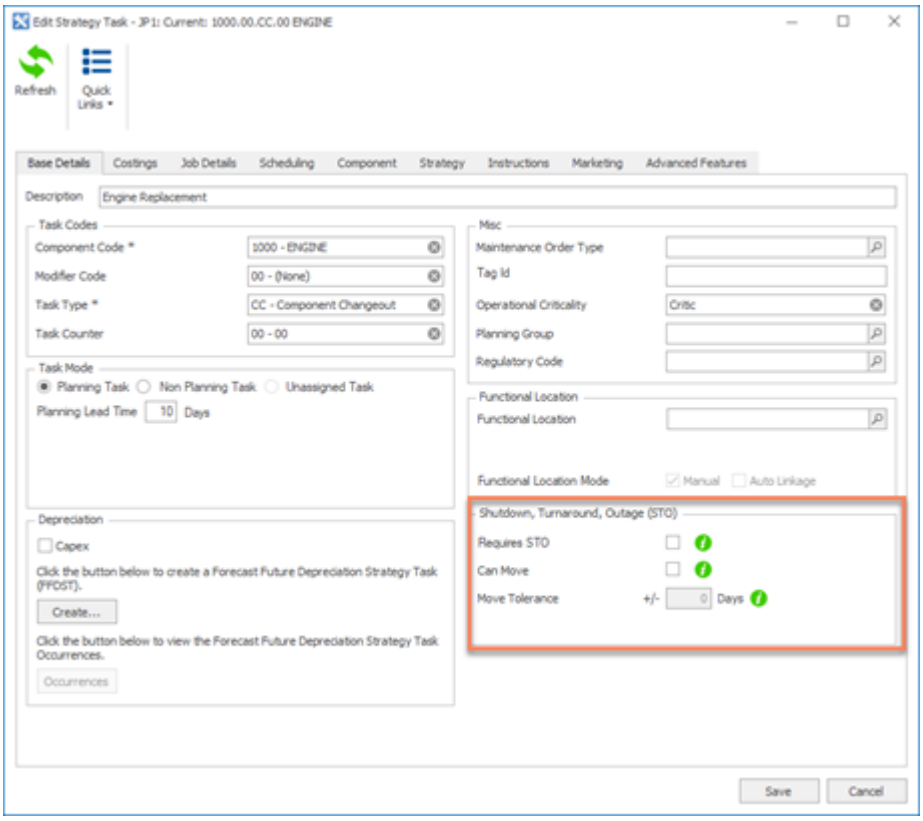

Asset	Standard Job	Resulting Strategy Task
Requires STO = Yes	Requires STO = No	Requires STO = Yes
Requires STO = No	Requires STO = Yes	Requires STO = Yes
Requires STO = Yes	Requires STO = Yes	Requires STO = Yes
Requires STO = No	Requires STO = No	Requires STO = No

Business Process rules - Strategy task occurrence moves

When a Strategy Task (and therefore its associated individual occurrences) is identified with Requires STO, rules on the Strategy Task can be configured which determine whether the work item has flexibility to move, and if it can move, what flexibility is available.

Occurrences associated with a strategy task are governed by the new fields found on the **Base Details** tab > **Shutdown, Turnaround, Outage (STO)** section:

- Can Move.
- Move Tolerance.

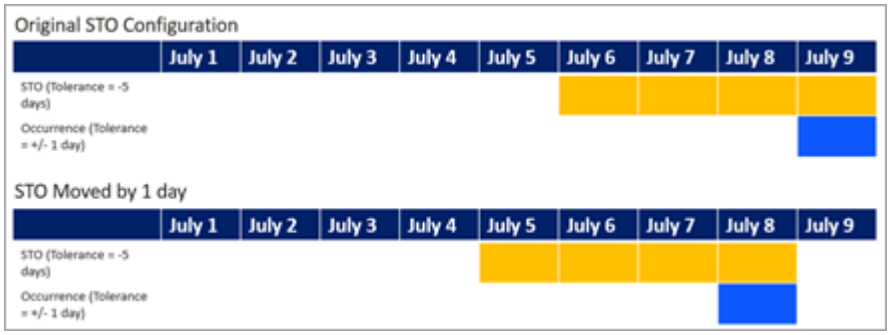

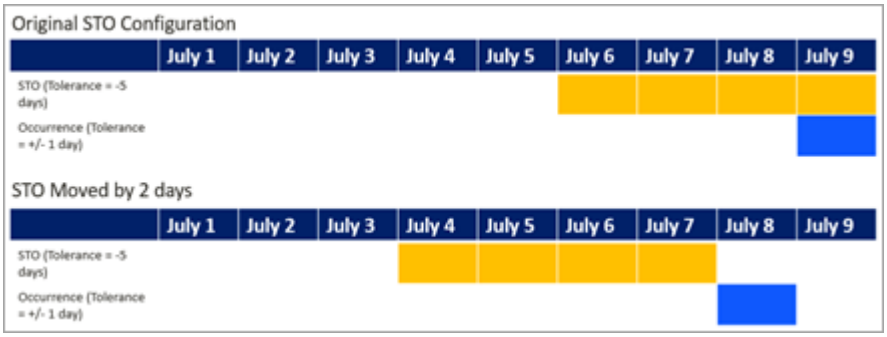

The Requires STO flag is also found in this section.

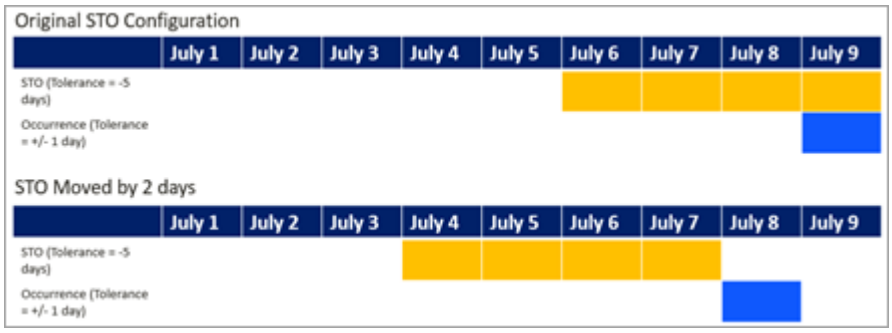

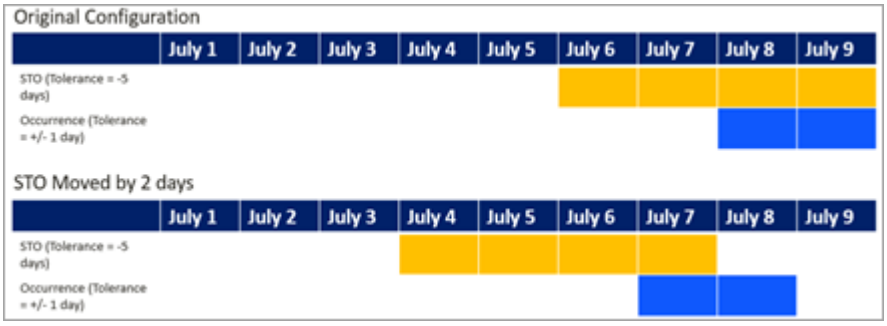

Can Move

If not selected, allows the occurrence to move without constraint. If it is selected, the tolerance for movement comes into the business rule.

If **Can Move** is selected, and the **Move Tolerance** is **0**, this means that the Strategy Task Occurrence dates cannot move.

If **Can Move** is selected together with a **Move Tolerance** value greater than **0,** this means the Strategy Task Occurrence can be moved in Long-term Planning. The number of days determines by how much the occurrence can move relative to its original plan dates. The setting may determine that the occurrence cannot move if the nominated STO dates change and they then fall outside the tolerance limits.

STO Configuration	Strategy Task Configuration	Occurrence Planned Start Date	STO Moved	Business Rule Outcome
STO (duration = 4 days) can move up to 5 days earlier than start date.	Occurrence can move either one day earlier or one day later.	Occurrence (duration = 1 day) is due to start on the last day of the 4-day shutdown.	STO is moved to start one day earlier.	STO business rules allow the occurrence to move.
				
STO (duration = 4 days) can move up to 5 days earlier than start date.	Occurrence can move either one day earlier or one day later.	Occurrence (duration = 1 day) is due to start on the last day of the 4-day shutdown.	STO is moved to start two days earlier.	STO business rules do not allow the occurrence to move.
				
STO (duration = 4 days) can move up to 5 days earlier than start date.	Occurrence can move either one day earlier or one day later.	Occurrence (duration = 2 days) is due to start on the second last day of the 4-day shutdown.	STO is moved to start one day earlier.	STO business rules allows the occurrence to move.

STO Configuration	Strategy Task Configuration	Occurrence Planned Start Date	STO Moved	Business Rule Outcome
				
STO (duration = 4 days) can move up to 5 days earlier than start date.	Occurrence can move either one day earlier or one day later.	Occurrence (duration = 2 days) is due to start on the last day of the 4-day shutdown.	STO is moved to start two days earlier.	Occurrence rules do not allow the occurrence to move.
				

STO Manager

The STO Manager provides a flexible definition for Shutdowns, Turnarounds or Outages across multiple assets, with the ability to include planned and unplanned maintenance activities. The STO can vary in duration from very short to weeks and months. STOs are generally planned many months, and may often be planned years, in advance.

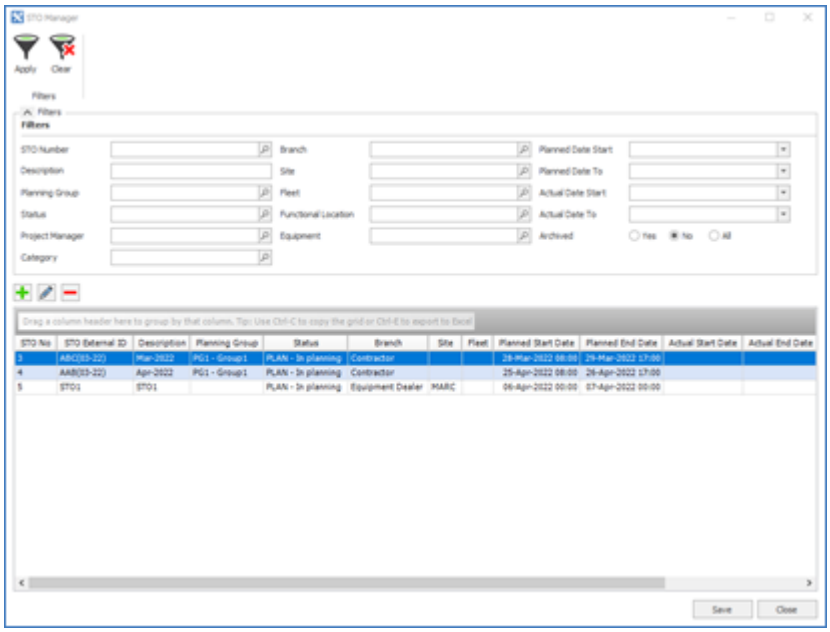

Planned Start and End dates can be defined; this will calculate a duration. An STO may need to move depending on operational and production constraints; therefore, the ability to configure its ability to move has been introduced. By how much it can be move may be of relevance for some customers.

With the introduction of the STO feature, the STO is constrained to a branch only; the site constraint has been removed. This allows the new STO capability to plan a shutdown that impacts equipment belonging to several fleets or sites within a single branch.

New screen - STO Manager

Search screen with filters and grid results display.

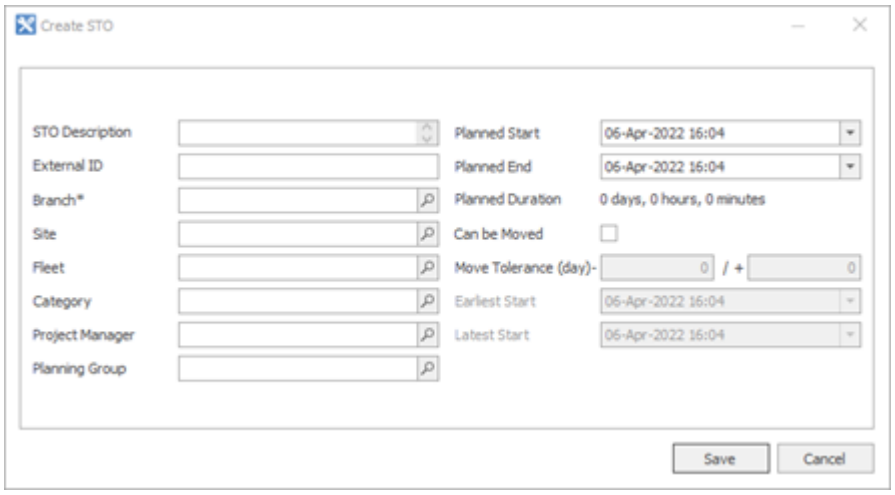

At the top of the grid, icons exist to add a new STO (new screen), edit an existing STO (new screen) or delete a selected STO.

- STO Number – Multi-select option.
- Description – Searches for any matching STO based on string entered; this string can be anywhere within the description.
- Planning Group – Multi-select option; validates against Planning Group.
- Status – Multi-select option; validates against STO_Status table.
- Project Manager – Multi-select option; validates against Employee.
- Category – Multi-select option; validates against STO Category.
- Branch – Multi-select option; validates against Branch.
- Site – Multi-select option; validates against Site.
- Fleet – Multi-select option; validates against Fleet.
- Functional Location – Single select option.
- Equipment – Multi-select option; validates against Equipment.
- Planned Start Date.
- Planned Date To.
- Actual Start Date.
- Actual Start To.
- Archived.

- Yes - display only archived status STOs that match the filter criteria.
- No - display all STOs that are NOT archived that match the filter.
- All.

New screen - Create STO

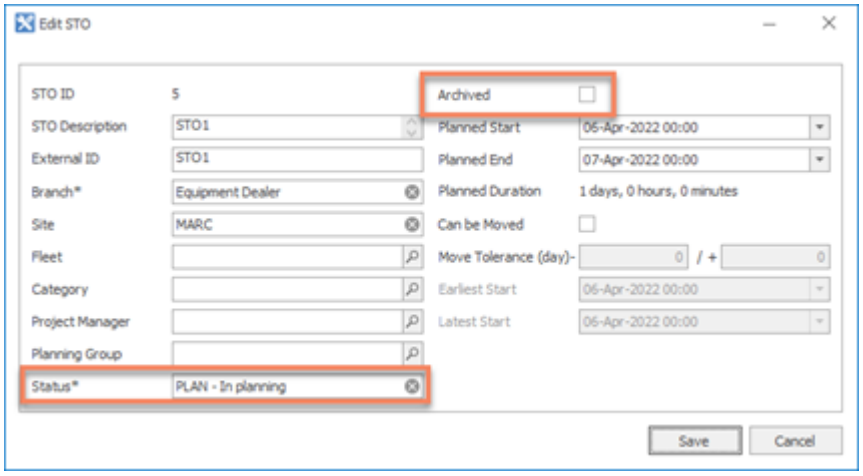

- Description – describes the intent of the STO, for example, what the STO covers.
- External ID – Allows an external identifier to be entered which could, for example, be PCrsh 04-22 which equates to a shutdown in week 4 of 2022 for the Primary Crusher. If no external identifier is nominated the sequential system generated AMT number will be used.
- Branch – mandatory field.

All other fields are optional.

- Planned Start Date.
- Planned End Date.
- Planned Duration - will calculate from Planned Start Date and Time and Planned End Date and Time nominated.
- Can be Moved – check box; if not selected the Planned Start and End Date and Time is fixed.
- Move Tolerance (day) – enabled by Can be Moved check box.
  - – (days) – identifies the number of days prior to the Planned Start date by which the STO can move; this calculates the Earliest Start Date.
  - + (days) - identifies the number of days after to the Planned Start date by which the STO can move; this calculates the Latest Start Date.

On **Save**, the STO is created with an In Planning status.

New screen - Edit STO

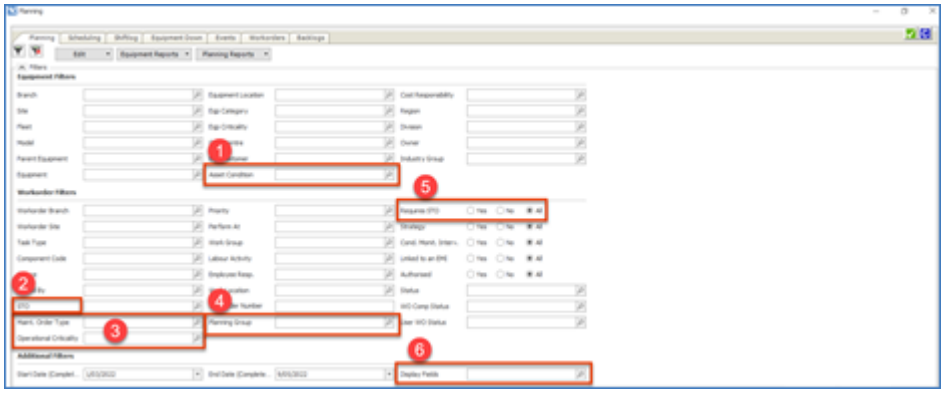

The difference between the Create STO screen and Edit STO screen is the additional fields:

- Status – Allows various statuses of an STO to be recorded.
- Archived – Allows the STO to be archived; by default this will remove the STO from the returned search (Archived default = No).

Daily Planning

New Search Filters - Daily Planning > Planning

New filters have been added to the **Planning** tab.

1. **Asset Condition** added as a filter for Equipment.
2. **STO (Shutdown, Turnaround, Outage)** will display when Advanced Planning (Feature 36) is enabled instead of Maintenance Point.

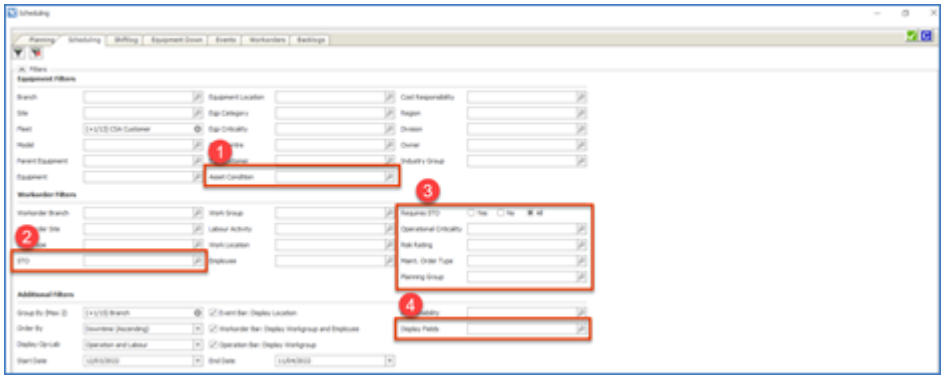

The **STO filter will not return data in this release**. This will be available in the next AMT release.

3. **Maintenance Order Type** and **Operational Criticality** added as filters for Work Orders.
4. **Planning Group** added as a filter for Work Orders.
5. **Requires STO** radio buttons added as filters for Work Orders.
6. New fields have been added into Display Fields – **MOT (Maintenance Order Type), Operational Criticality**, **Planning Group**, **Requires STO**, **Risk Override** and **Risk Rating (Calculated)**.
    - Shutdown field will display as STO when Advanced Planning (Feature 36) is enabled.

Users will see some additional filters and display fields which have been included in preparation for functionality coming in the next release. These filters and display columns will not display any data. Fields involved are Operational Criticality, Requires STO, Risk Rating and Risk Override.

New Search Filters - Daily Planning - Scheduling

New filters have been added to the **Scheduling** tab.

1. **Asset Condition** added as a filter for Equipment.
2. **STO (Shutdown, Turnaround, Outage)** will display when Advanced Planning (Feature 36) is enabled instead of Maintenance Point.

    The STO filter will not return data in this release. This will be available in the next AMT release.

3. Additional filters for Work Orders.
    a. Requires STO radio buttons.
    b. Operational Criticality.
    c. Risk Rating.

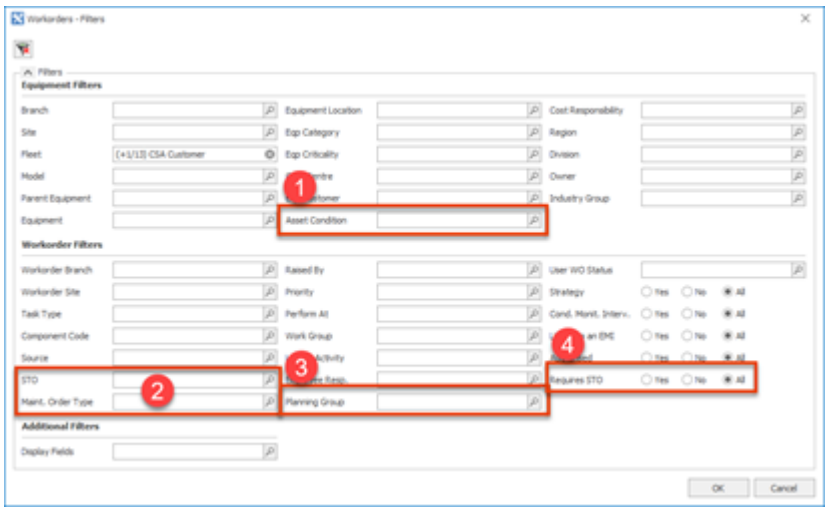

d. Maintenance Order Type.

e. Planning Group.

4. Display Fields option has been added for the grid – **MOT (Maintenance Order Type)**, **Operational Criticality**, **Planning Group**, **Requires STO**, **Risk Rating (Calculated)** and **Risk Override**.

New Work Order Filters - Scheduling > Work Orders

New filters have been added to the **Workorders** tab.

1. **Asset Condition** added as a filter for Equipment.
2. **STO (Shutdown, Turnaround, Outage)** will display when Advanced Planning (Feature 36) is enabled. **STO**, **Maintenance Point** and **Maintenance Order Type** have been added as Work Order filters.

   The STO filter will not return data in this release. This will be available in the next AMT release.

3. **Planning Group** added as a filter for Work Orders.
4. **Requires STO** radio buttons added as filters for Work Orders.

Users will see some additional filters and display fields which have been included in preparation for functionality coming in the next release. These filters and display columns will not display any data. Fields included are Operational Criticality, Requires STO, Risk Rating and Risk Override.

New Search Filters - Daily Planning > Shiftlog

New filters have been added to the **Shiftlog** tab.

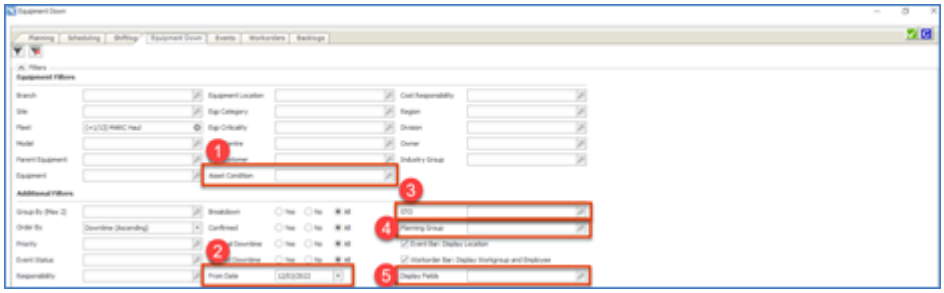

1. **Asset Condition** added as a filter for Equipment.
2. **STO** (Shutdown, Turnaround, Outage) will display when Advanced Planning (Feature 36) is enabled. STO and Maintenance Point and Maintenance Order Type have been added as Work Order filters.

   The STO filter will not return data in this release. This will be available in the next AMT release.

3. **Planning Group** added as a filter for Work Orders.
4. **Responsible Employee** added as a filter for Work Orders.
5. New fields have been added into Display Fields – **Asset Condition**, **MOT (Maintenance Order Type)**, **Planning Group** and **STO**.

New Search Filters - Daily Planning > Equipment Down

New filters have been added to the **Equipment Down** tab.

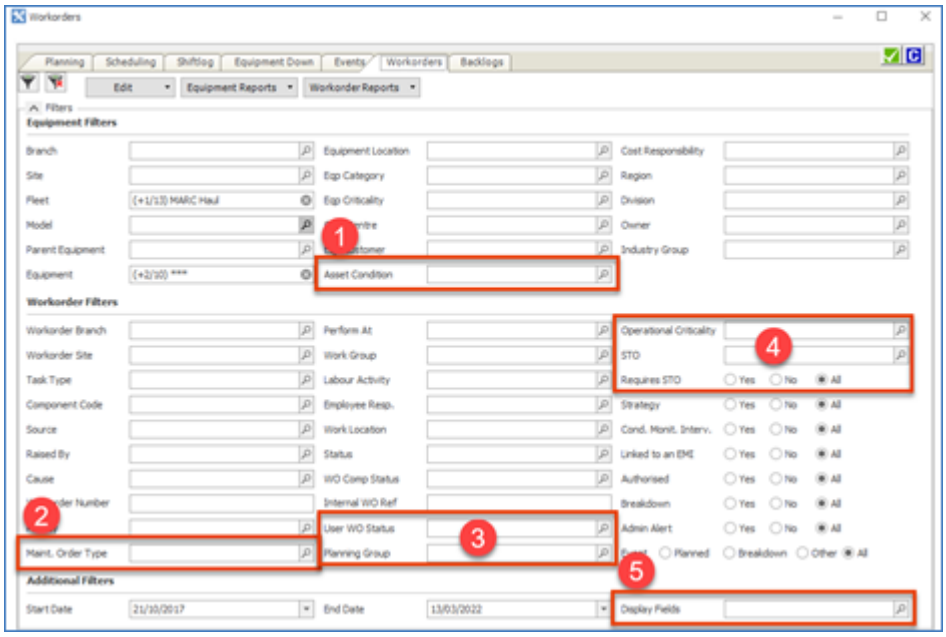

1. **Asset Condition** added as a filter for Equipment.
2. **From Date** filter has moved on the grid.
3. **Maintenance Period** (which displays as STO when Advanced Planning (Feature 36) is enabled) has moved from being displayed within Equipment Filters to display within the Additional Filters section.

   The STO filter will not return data in this release. This will be available in the next AMT release.

4. **Planning Group** added as an Additional filter.
5. **Display Fields** option has been added – Planning Group can be added as a display field in the grid.

New Search Filters - Daily Planning > Workorders

New filters have been added to the **Workorders** tab.

1. **Asset Condition** added as a filter for Equipment.
2. **Maintenance Order Type** added as a Workorder filter.
3. **User WO Status** and **Planning Groups** added as Workorder filters.
4. **Operational Criticality** and **Requires STO** added as a Workorder filters. **Maintenance Point** displays as STO if Advanced Planning (Feature 36) is enabled.

   The STO filer will not return data in this release. This will be available in the next AMT release.

5. Display Fields option has been added – **MOT (Maintenance Order Type)**, **Operational Criticality**, **Planning Group**, **Requires STO**, **Risk Override** and **Risk Rating (Calculated)** can be added as display fields in the grid.

   Users will see some additional filters and display fields which have been included in preparation for functionality coming in the next release. These filters and display columns will not display any data. Fields included are Operational Criticality, Requires STO, Risk Rating and Risk Override.

New Search Filters - Daily Planning > Backlogs

New filters have been added to the **Backlogs** tab.

1. **Asset Condition** added as a filter for Equipment.
2. **Maintenance Point** added as a Workorder filter and displays as STO if Advanced Planning (Feature 36) is enabled.
3. **Operational Criticality**, **Planning Group** and **Maintenance Order Type** added as Workorder filters.
4. **Requires STO** added as a Workorder filter.

   An STO filter will not return data in this release. This will be available in the next AMT release.

5. Display Fields option has been added – **MOT (Maintenance Order Type)**, **Operational Criticality**, **Planning Group**, **Requires STO**, **Risk Override** and **Risk Rating (Calculated)** can be added as display fields in the grid.

   Users will see some additional filters and display fields which have been included in preparation for functionality coming in the next release. These filters and display columns will not display any data. Fields included are

Work Order

Edit Workorder

Additional fields have been added to the AMT Workorder. Layout changes have been made to accommodate these fields.

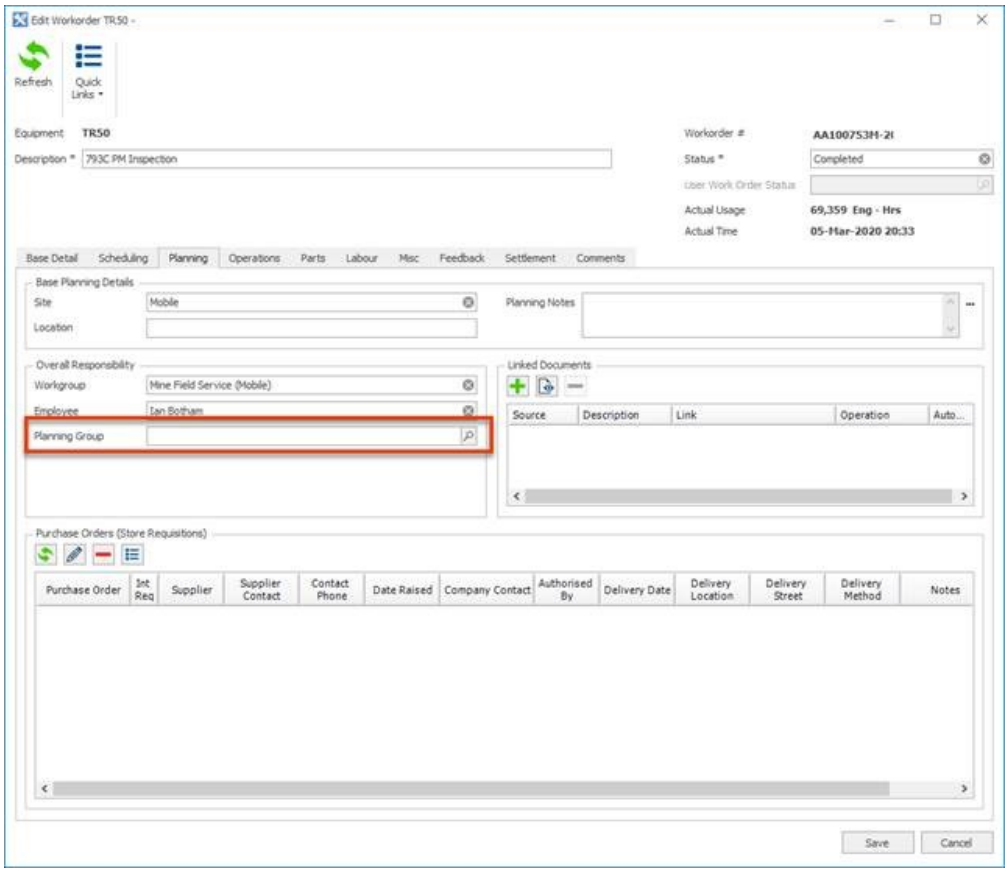

Edit Workorder > Base Details tab

1. Work order number can be copied. Highlight the Workorder number and right-mouse click. Copy allows the work order number to be copied and pasted into a different application.
2. Maintenance Order Type has been added to the Other Details panel.
3. Regulatory Code has been added to the Other Details panel.
4. Created By is a new panel. It contains the Created By and Date Created information which has been moved from the Other Details panel.

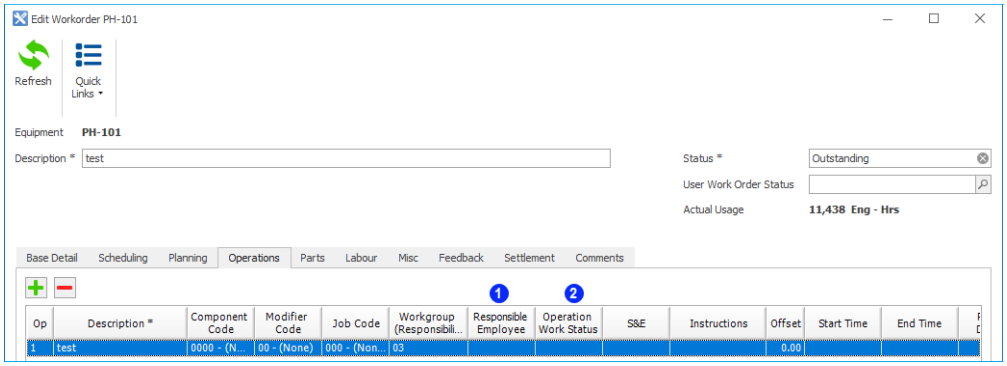

Edit Workorder > Planning tab

Planning Group has been added to the Overall Responsibility panel.

Edit Workorder > Operations tab

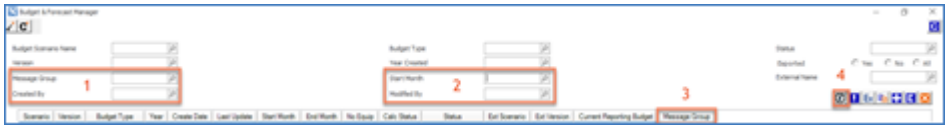

New fields have been added to the work order operation to support AMT Mobile 2.0.

1. A **Responsible Employee** can be added to each Operation. This is not a mandatory field.
2. **Operation Work Status** has been added at the operational level to support the allocation and completion of work on a mobile device at the operational level. A new system table has been created (see Operation Work Status). This field is not mandatory; there is no relationship between this field and the work order header status at this stage. This field has been introduced to support AMT Mobile 2.0 with SAP.

Budgeting & Forecasting

Screen changes - Budget & Forecast Manager

1. **Message Group** has been added as a filter with a multi-select option. **Created By** has been added as a filter with a single-select option.
2. **Start Month** has been added as a filter with a multi-selection option. This will complement the Year Created existing filter. **Modified By** has been added as a filter with a single-select option.
3. **Message Group** has been added to the results displayed. Message Groups (see below) can be used to send email notifications to members of the Message Group when the budget status has been changed.
4. New icon included which displays the **Budget System Task Status** (see below).

Maintenance Point and **Project Code** have been removed as columns from the grid. While Maintenance Point had been added to the screen there was actually no additional functionality added that did anything with this item within the budget process.

Budgets will only show in the grid for equipment in the user's organization. The grid will only show budgets that contain equipment to which the user has access. If a budget contains multiple equipment, to which the user has access to some but not all, this budget will display in the grid.

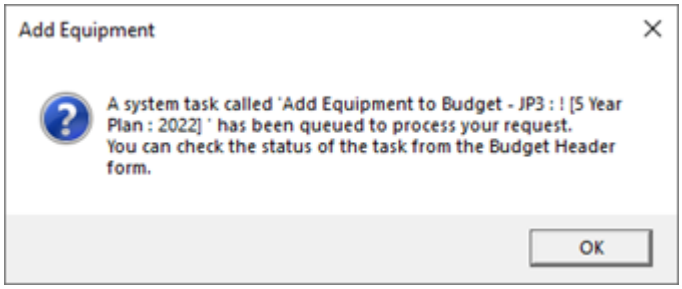

The **Requires STO** flag now displays with the Cost Occurrence information.

Budget System Task Status

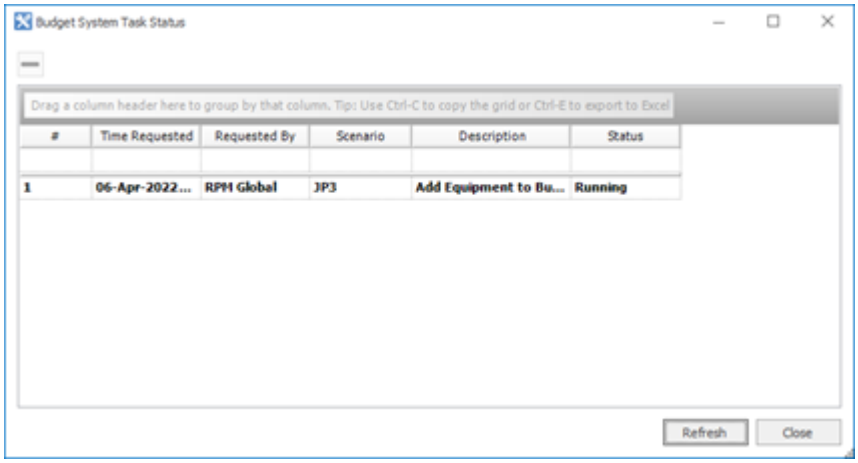

AMT v8.23 includes the capability to place one or more budget calculations into a queuing process with the earliest requested time at the top. This removes the historical user experience where only one budget could calculate and if this calculation took some time, no other budget could be created.

From AMT v8.23, a large decentralised organization can create and queue any number of budgets by different users and each budget will process consecutively based on their 'requested' time.

When the budget is first created or subsequently modified, the user will now receive a message advising their budget has been queued.

The Budget System Task Status will display each budget scenario with a sequence number based on the time it was requested. Additional information displays who requested the budget, the scenario and scenario description and the current status of the system task. Queued budgets are visible and each budget moves from queued to running progressively. When complete, the budget will disappear from the list and the next budget in the sequence will start its calculation process.

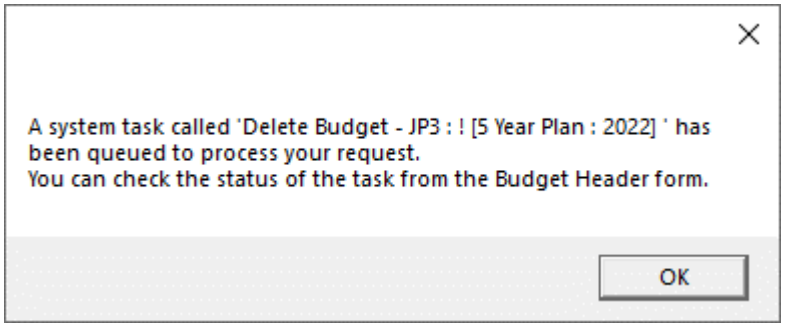

When the budget status is running, the budget cannot be deleted from the list. However, if the budget status is queued, the budget may be deleted from the list by highlighting the budget and selecting the delete icon located above the grid on the left-hand side.

Users can only delete their own budgets unless they are a system administrator.

When a user opens the Budget System Task Status screen, their first task in the queue is highlighted. All other tasks created by them will be in bold text in the list. This will assist with the user being able to more easily see where their tasks are sitting if the queue is long.

Deleting a budget

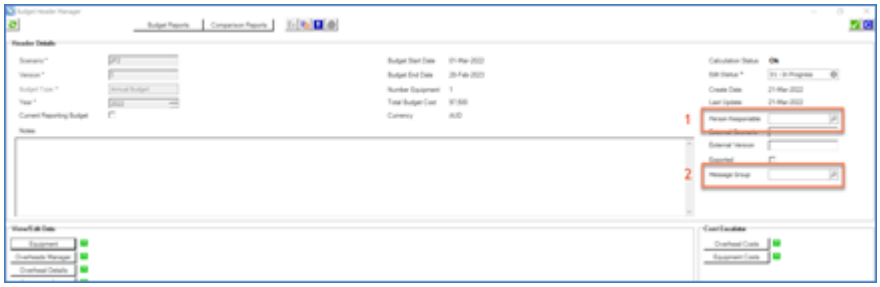

When a budget is deleted from the Budget & Forecast Manager, it will now call a system task for this process to improve performance. A message advises the user that this process has been queued.

Once the system task is complete, the budget will be deleted entirely; the user will need to refresh the Budget & Forecast Manager search grid to see the deleted budget removed from the grid.

If the grid has not been refreshed, the budget will still display, however, the user will not be able to perform any other process on the budget such as edit, recalculate, and so on.

Budget Header Manager

1. **Person Responsible** can still be entered as text, however, a Person Responsible can also now be selected from a list of employees.
2. **Message Group** has been added to Budget Header Manager. This will display any Message Group added at the time of creating the budget and will allow this field to be edited as needed at a later time. If a Message Group was not added at the time of creating the budget, a Message Group can be added in this screen. Notification emails, if configured, will only apply from after this change.

Budgeting & Forecasting approval process

Historically, AMT has provided only an **Editable** and **Locked** status to manage a budget's status.

AMT v8.23 sees an introduction of a budget workflow process that considers the steps through which a budget may progress. This workflow considers the workflow status including email notification; it does not consider budgetary value.

There are two parts to enabling the access for a user to be able to modify the Budget Status field in Budget & Forecast Manager.

1. The user must have access enabled to **Budget Status**.
    - The Budget Status Permissions on the user's account determines whether the user has permission to access and change the budget status field.
2. The user's **Group Permissions** must have **Edit** or **All** access to the Budget & Forecast Manager. If they do not have access to the screen, then they cannot make changes on the screen.

While the user could be given access to ALL Budget Statuses, a more appropriate and business-focused process would be to give different users access to different statuses that enable and match their participation in the budget review process and its approval workflow.

How an organisation wishes to control changes to the budget could mean that a budget with an In Progress status is the only status that is editable. Therefore, when the Planner changes the status to Under Review, it will stop further changes being made to the budget. Users who review the budget can made suggestions for changes, but the budget must revert to In Progress status in order for those changes to be actioned.

Alternatively, the Under Review status can also be set to editable which would mean that users with this status access can also make the change versus recommending the change via comments. It is a question of budgetary management and control that needs to be considered when introducing this new functionality.

For example, a Planner creates the budget; budget status = In Progress. The In Progress code in the Budget Status System Table is configured to allow the budget to be edited and has next approval steps set to Under Review or Reviewed. Planners may, or may not, be given access to any of the budget statuses. It may be the responsibility of the Planning Manager or a single Planner to progress budgets to the next stage once the budget is ready. The Planning Manager changes the status to Under Review and depending on the configuration of the budget status code here (see Budget Status system table), changes may or may not be able to be made to the budget results. If changes are allowed while the budget has this status, the code must have **editable** selected.

By the time the budget status is Reviewed or For Approval, the budget status codes should not be editable. If at this stage the budget needs to be changed, the budget status would be returned to an editable status code, the changes made and the budget review process restarted.

If the field in Budget & Forecast Manager is not enabled, check the Budget Status system table for the status of the **Read Only** flag.

Impact of Budget User Accounts Permission and screen changes in Budgeting & Forecasting

Menu Location: **Budgeting & Forecasting** > **Budgeting** > **Budget and Forecast Manager**.

Background

In AMT, a user cannot not create a direct equipment cost budget by adding equipment to which they did not have access. Prior to AMT v8.23, within the Budget & Forecast Manager, they could, however, open and modify another user's budget relating to equipment to which they may not have access.

The ability to protect and secure a budget appropriately is required for globally diverse AMT customers.

AMT has been enhanced to align with generally accepted budgeting principles, where a user's access to edit, review and approve budgets and forecasts is limited to their configured equipment restrictions (for example, Branch, Site) and one or more nominated cost centres.

AMT has been enhanced to ensure budgets are not created, modified or deleted by personnel who do not have authority for that budget area.

Enablement

Configure AMT User Budget Restrictions.

1. Default is ALL cost centres will equate to existing functionality.
2. One or more nominated cost centres.

Enhancements

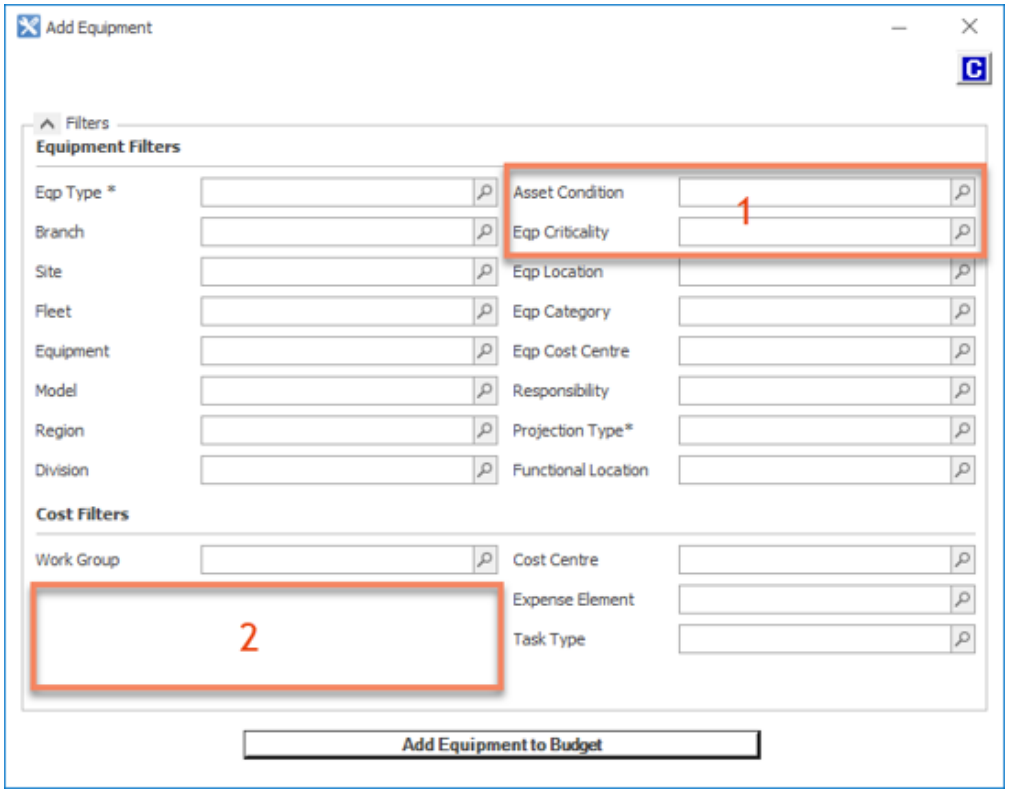

Regardless of any enablement of cost centres, Budget and Forecast Manager will respect a user's equipment restrictions and secure budgets accordingly.

Budget Equipment Manager screen

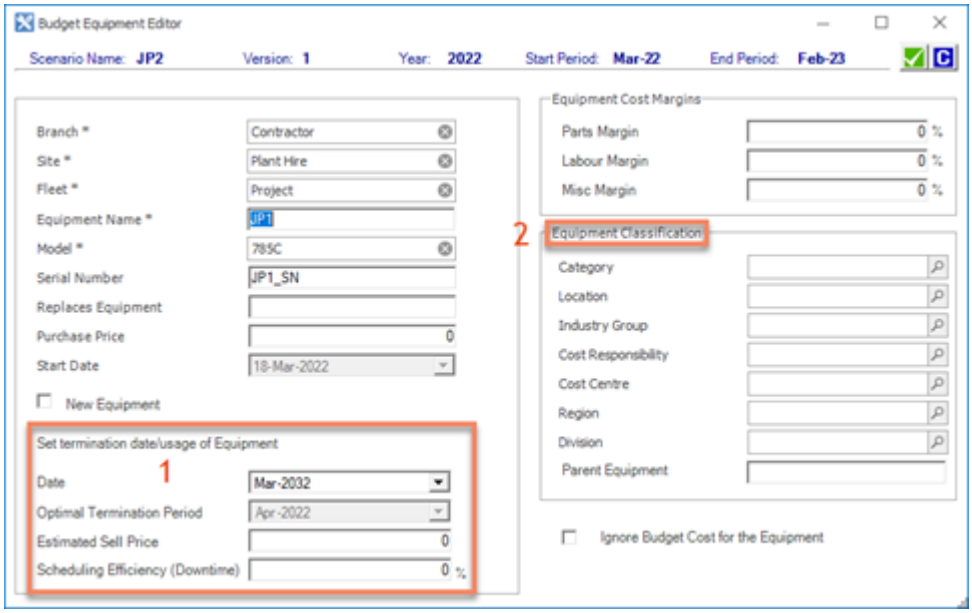

Added a **My Equipment** check box. By default, the check box is enabled; therefore, displaying on equipment that meet the user's Equipment Permissions criteria.

Add Equipment screen

1. Asset Condition and Equipment Criticality added - both are multi-select.
2. Project and Maintenance Point were removed from Cost Filters.

Budget Equipment Editor screen

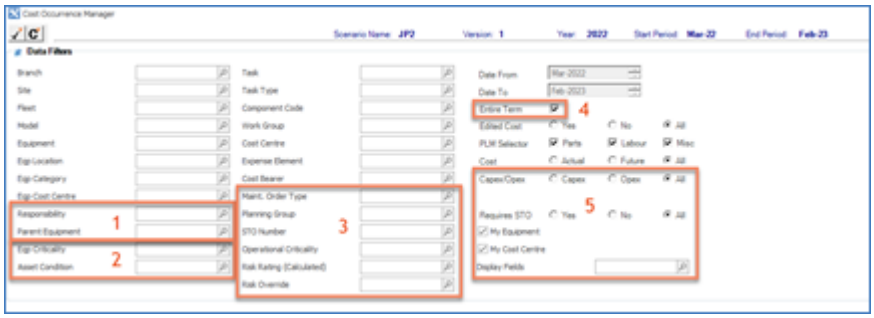

1. **Usage** and **Maximum End Usage** have been removed from the screen until such time as appropriate functionality can be included given the current constraints in the budget occurrence processes included in the budget. The budget snapshot is limited to the budget period only and any occurrences that fall within a 12-month period after that. These are the only occurrences that are available for any reforecasts.
2. The **Equipment Criticality** filter has been removed as a filter option in the **Equipment Classification** section.

Overheads Editor Screen

1. **Capex/Opex** filter added.
2. **My Cost Centre** check box added.
    - By default, the check box is selected, which means that only cost centres to which the user has permissions will display. If unselected, all overheads for all cost centres included in the budget will display.

Cost Occurrence Manager screen filters

There has been a rearrangement of existing filters on the screen to allow for additional new filters to be added. The rearrangement has, at times, provided for a more logical grouping of like filters where space and filter type allowed.

1. **Location**, **Eqp Category**, **Eqp Cost Centre** and **Responsibility** have been moved from the second column to the first. The first column now represents equipment fields.
2. **Added Equipment Criticality** and **Asset Condition** filters both have multi-select options.
3. **Task**, **Task Type**, **Component Code**, **Work Group**, **Cost Centre**, **Expense Element** and **Cost Bearer** have been moved from the third column to the second.
4. Added **Maintenance Order Type**, **Planning Group**, **STO Number**, **Operational Criticality**, **Risk Rating** (calculated) and **Risk Override** filters all have multi-select options.
5. **Labour Hour** and **Edited Labour Hours** have been moved on the screen
6. Additional filters added:
    a. **Capex/Opex** filter – default is All.
    b. **Requires STO** filter – default is All.
    c. **My Equipment** check box – default is enabled. The filter will display only equipment in the budget for which the user has permission. If disabled, all labour hours for all equipment in the budget will display.
    d. **My Cost Centre** check box – default is enabled. The filter will display only cost centres in the budget for which the user has permission. If disabled, all labour hours for all cost centres in the budget will display.
    e. **Display Fields** option has been added allowing additional columns to display in the grid. Optional Fields to display are:
        i. Asset Condition.
        ii. Capex.
        iii. Equipment Criticality.
        iv. Maintenance Order Type.
        v. Operational Criticality.

vi. Planning Group.

vii. Requires STO.

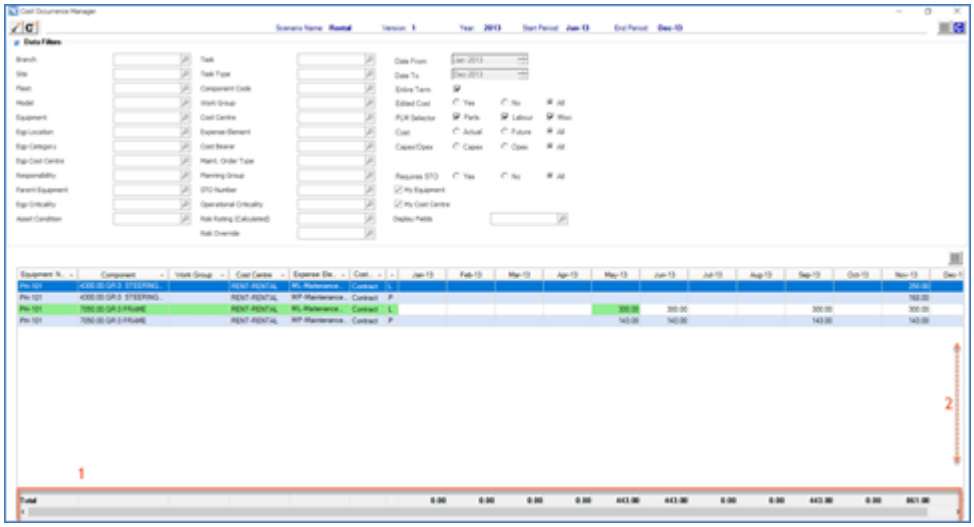

viii. Risk Override.

ix. Risk Rating (Calculated).

x. STO Number.

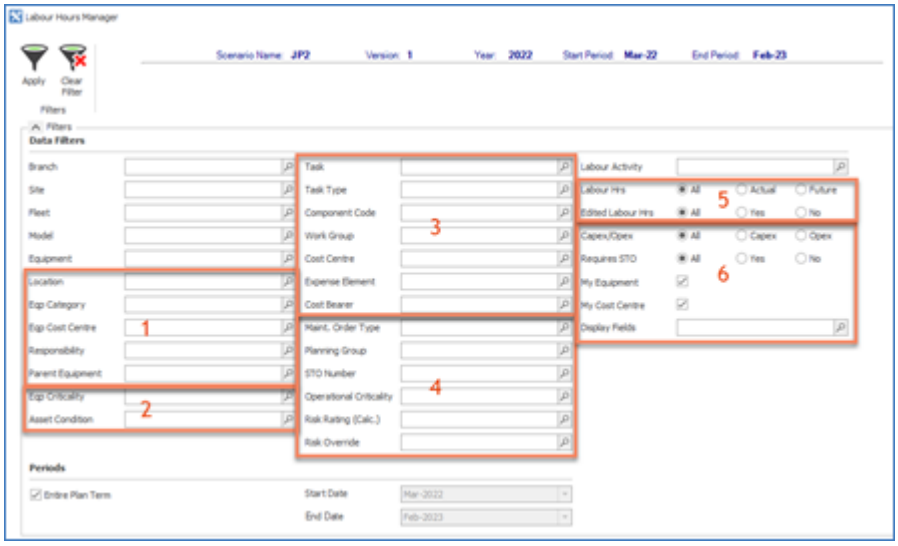

Cost Category has been removed as a filter on this screen.

Cost Occurrence Manager grid

1. Total row has been pinned at the bottom of the grid. The value in the total row will be the sum of all costs in the budget. If the user does not have permissions for all costs within the budget this will NOT adjust the total values. Costs for which the user does not have permission (either due to their equipment permissions and/or cost centre permissions) will display in italics in the grid and cannot be changed. Numbers in italics will display if the user clears the My Equipment and/or My Cost Centre check boxes.
2. If more cost results display in the grid than fit the display window, a scroll bar will appear on the right hand side of the grid.

Labour Hours Manager

1. **Location**, **Eqp Category**, **Eqp Cost Centre** and **Responsibility** have been moved from the second column to the first. The first column now represents equipment fields.
2. **Added Equipment Criticality** and **Asset Condition** filters both have multi-select options.
3. **Task**, **Task Type**, **Component Code**, **Work Group**, **Cost Centre**, **Expense Element** and **Cost Bearer** have been moved from the third column to the second.
4. Added **Maintenance Order Type**, Planning Group, **STO Number**, **Operational Criticality**, **Risk Rating** (calculated) and **Risk Override** filters all have multi-select options.
5. **Labour Hour** and **Edited Labour Hours** have been moved on the screen.
6. Additional filters added:
    i. **Capex/Opex** filter – default is All.
    ii. **Requires STO** filter – default is All.
    iii. **My Equipment** check box – default is enabled. The filter will display only equipment in the budget for which the user has permission. If disabled, all labour hours for all equipment in the budget will display.
    iv. **My Cost Centre** check box – default is enabled. The filter will display only cost centres in the budget for which the user has permission. If disabled, all labour hours for all cost centres in the budget will display.
    v. Display Fields option has been added allowing additional columns to display in the grid. Optional Fields to display are:
        i. Asset Condition.
        ii. Capex.

iii. Equipment Criticality.
iv. Maintenance Order Type.
v. Operational Criticality.
vi. Planning Group.
vii. Requires STO.
viii. Risk Override.
ix. Risk Rating (Calculated).
x. STO Number.

Equipment Utilisation screen

1. **Asset Condition Equipment** filter has moved from the second column to the first.
2. Added **Equipment Criticality** and **Asset Condition** filters - both have multi-select options.
3. Added **My Equipment** check box – default is selected. The filter will display only usages for equipment in the budget for which the user has permission. If unselected, all usages for all equipment in the budget will display.

Equipment Downtime/Duration screen

There has been a rearrangement of existing filters on the screen to allow for additional new filters to be added.

1. **Downtime Source** filter has moved from the second column to the first.
2. Added **Equipment Criticality** and **Asset Condition** filters; both have multi-select options.
3. Added **My Equipment** check box – default is enabled. The filter will display only durations for equipment in the budget for which the user has permission. If selected, all durations for all equipment in the budget will display. If unselected, all usages for all equipment in the budget will display.

Headcount Manager screen

Added **My Cost Centre** check box – default is enabled. The filter will display only headcount for cost centres in the budget for which the user has permission. If unselected, all headcounts for all cost centres in the budget will display.

Budget Project Manager screen

Added **My Equipment** check box – default is enabled. The filter will display only equipment in the budget for which the user has permission. If unselected, all equipment in the budget will display.

Budget Revenue screen

Added **My Equipment** check box – default is enabled. The filter will display only revenue for equipment in the budget for which the user has permission. If unselected, all revenue for all equipment in the budget will display.

Added **My Cost Centre** check box – default is enabled. The filter will display only revenue for cost centres in the budget for which the user has permission. If unselected, all revenue for all cost centres in the budget will display.

Business Rules

1. Assets within AMT include a Default Cost Centre; however, this is not a mandatory field. Strategy Task Jobs include a Cost Centre. The Strategy Task Cost Centre will default from the asset's Default Cost Centre when a strategy task is created manually in AMT. It can be overwritten on the Strategy Task; any budget created from this Strategy Task references the overwritten Cost Centre versus the asset's Default Cost Centre. The Strategy Task Cost Centre is also not a mandatory field.

   With both fields not being mandatory, this means that a budget can be generated without referencing a cost centre, that is, the cost centre will be blank.

   While AMT will bring in the capability to limit budget modification based on cost centre, no changes will be made to the current functionality with equipment and strategy task as relates to the cost centre completion. This means that if a user wants to limit a budget processes based on cost centre, it will rely on the users completing one or both of the equipment and strategy task cost centres.

2. When a budget is created by a user and includes equipment with task costs for a cost centre for which the user does not have responsibility (that is, no access), the user will be shown a warning message. **Message**: *Equipment selected include cost centre costs for cost centres you can't access. These costs are excluded. Please refer to your management for budgetary access requirements.*

3. A user will not be able to delete equipment from the budget if they do not have access permission to it.

4. There are three Update Routines in Budget Equipment Manager:

   a. Replace usage with actuals.

   b. Replace costs with actuals/current projection.

   c. Replace actual costs to Month.

   These routines will consider initially the onscreen filters which means that if the filters display only 10 of the 20 budget equipment, only these equipment will be updated by the routine. Next, the routine will consider only the user's permissions to equipment. If the user does not have access to the equipment, the equipment will be excluded from the update routine. A message advises the user that equipment is being excluded due to their permissions.

   The user permissions to equipment are the only permissions that are applied to further limit the update. Cost Centre permissions are not considered.

5. The Overhead Manager Update Routine will consider the sites to which the user has access.

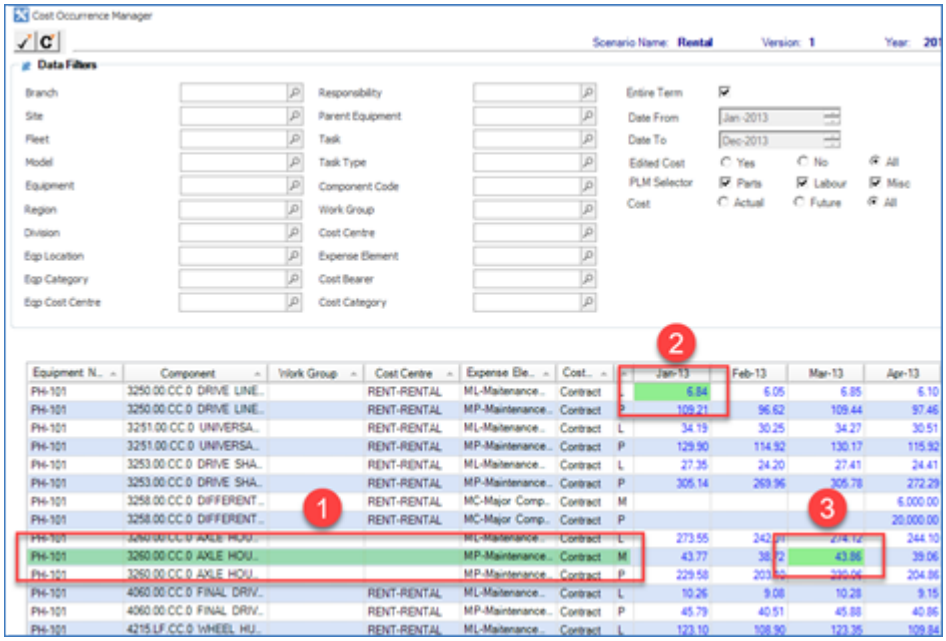

6. Overhead Cost Escalations will consider the site and cost centre permissions. A message will be given to the user for any violations. **Message**: *Overheads selected include overheads for sites or cost centres you can't access. These overheads have been excluded. Please refer to your management for access requirements.*
7. Equipment Cost Escalations will consider the equipment and cost centre permissions. A message will be given to the user for any violations. **Message**: *Equipment selected include equipment and cost centres you can't access. These equipment and cost centres have been excluded. Please refer to you management for equipment access requirements.*
8. Copy and Paste in all grids will only allow the user to be able to paste grid rows to which they have access. When trying to paste values into non-permitted rows the user will receive the message *Data cannot be updated to cells in italics. Please refer to your management for any access changes needed*.

Budget comments

Textural comments against the budget has been included within the **Cost Occurrence Manager**. **Comments** can be added at a Period (cell) level or at a budgetary line level.

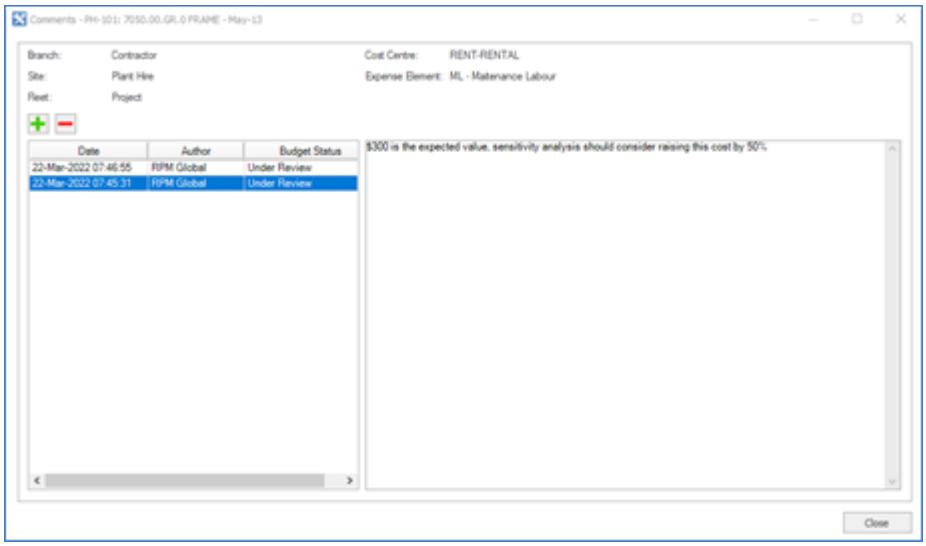

Budget comments are added using the right mouse click within a specific Budget Period or on the line level anywhere where the budget line attributes are displayed. Comments is an additional option that displays in the list of options that previously displayed – Copy the table, Paste and Edit Occurrences.

If comments have been added, a green background displays for the cell or line.

1. Line Item level comments exist on this **strategy task**. The non-period cells are all shown with a green background to indicate one or more comments exist at the line item level.
2. **Period Cell** level comments exists for this period cell.
3. Another example of comments at the period cell level. **This strategy task also has comments at the Line Item level**.

A new Comments review form is available. This form displays on selection of the Comments option (once the first comment has been added the review screen below displays).

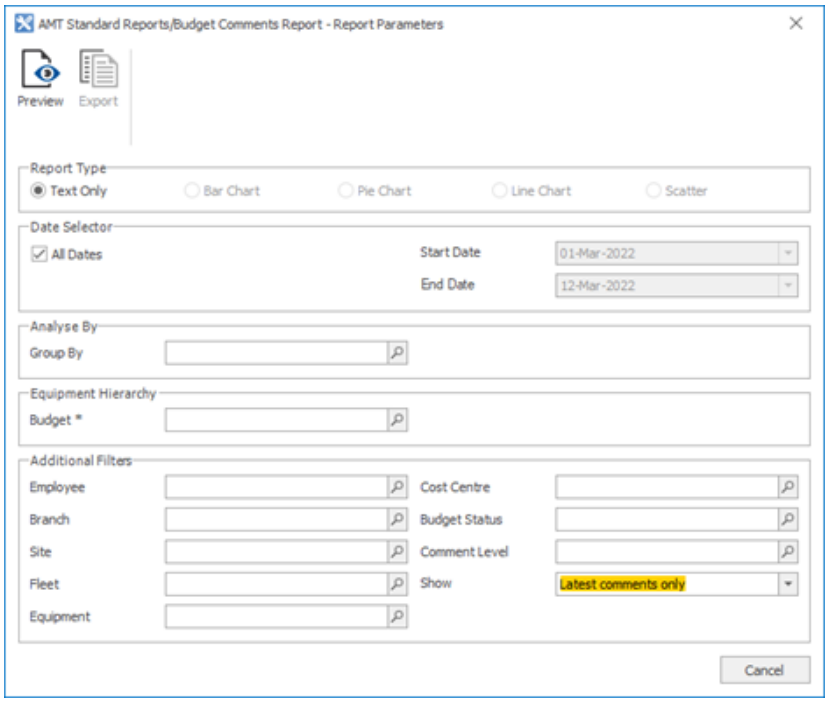

When the comment is recorded, it will default to the current date and time, the User ID/Employee Name and the Budget Status when the comment was recorded.

The screen shows all comments associated with the current line item or period cell selected. Any line item or period cell can have multiple comments over time. AMT will keep a history of these comments and displays these comments in reverse chronological order (that is, the latest comment will display first in the list).

New report - Budget Comments

A flexible text-only report is available to print comments for a selected Budget Header. This report can cover a date range, be grouped and identify which comments should be included.

1. Date Selector.
    - All comments can be selected or comments for a specified date range.
2. Analyse By.
    - The comments reported can be grouped by up to three filters from the following: Branch, Site, Fleet, Equipment, Cost Centre, Budget Status, Level (line or cell) and Employee.
3. Budget.
    - Nominate the budget whose comments are to be reported.
4. Additional Filters.
    a. Employee.
    b. Branch.
    c. Site.
    d. Fleet.
    e. Equipment.
    f. Cost Centre.
    g. Budget Status.
    h. Show:

i. Latest Comments only.
ii. All Valid Comments.
iii. All Comments including deleted comments
iv. Deleted Comments only.

Knowledge Database

Standard Job Expense Allocation

Background

AMT has been enhanced to support the consolidation of costs from the standard job across one or more expense elements. This expense allocation then flows through to the strategy task and any budget generated from those strategy tasks.

This new functionality supports individual parts, labour activities and miscellaneous categories configured to different expense elements for budgeting purposes and for these expense allocations to be respected as standard jobs are linked to strategy tasks and budgets developed. The expense allocation summarises all costs by unique expense element.

Expense elements can be associated with the master data part, labour activity and miscellaneous category. If no code is specifically associated, AMT will use the default code configuration in the **Expense Element** system table.

AMT will use a hierarchical process that will determine the expense element to use for the expense allocation:

If an expense element is specifically overwritten on a standard job operation line item, this expense element is used. Otherwise, the expense element used will be that specifically identified on the master data part, labour activity or miscellaneous category. In addition, the expense element will be the nominated default expense elements for parts, labour and miscellaneous category.

Enablement

1. **dbo.AMT_TYPED_VARIABLE**: StandardJobExpenseAllocation.
    - 0 = Disabled.
    - 1 = Enabled.
2. Configure Expense Element system table.
    - Set up default options.
3. Configure Parts Manager.
    - Identify any specific expense element associations.
4. Configure Labour Activity system table.
    - Identify any specific expense element associations.

5. Configure Misc Category system table.
    - Identify any specific expense element associations.

Enhancements

1. Identification of default expense elements for parts, labour and miscellaneous. Only one expense element code can be the default code at any point in time for parts. Similarly for labour and miscellaneous.

    While AMT does not stop a customer from configuring one expense element to be the default for more than one of parts, labour and miscellaneous, it is expected that the codes would generally be unique. That is, the default Parts Expense Element would not be the same as the default Labour Expense Element which would not be the same as the default Miscellaneous Category Expense Element.

2. Identification of expense elements for individual parts, labour activities and miscellaneous categories if these are different to the default expense element configuration.
3. Identification of an expense element per operation line item on the standard job for parts, labour activity and miscellaneous category if the expense element on the standard job needs to be different from either the default or any individual part, labour or miscellaneous item configuration.

    The expense element allocation follows a defined ‘default’ process as described in the Enablement section. It should be noted therefore, if the expense element is expressly defined on the standard job operation line item, the expense element will remain as per this definition until expressly overwritten; no defaults on parts, labour or expense elements come into effect. This is different from the process if, for example, the default expense element was defined initially as one expense element and subsequently changed to another. In this situation, the standard job would use the new default when deriving the expense allocation.

Modified Standard Job Manager (Priced Job) screen filters

Menu Location: **Knowledge Database** > **Standard Job Manager**.

Part Number filter has moved from the third column into a new fourth column.

New multi-select filters added for **Labour Activity**, **Misc Category** and **Expense Element**.

The expense element search will search all standard jobs that have an expense allocation that references the expense elements included.

Modified Standard Job (Priced Job) - Parts tab

Expense Element column added to the grid.

Modified Standard Job (Priced Job) - Labour tab

Expense Element column added to the grid.

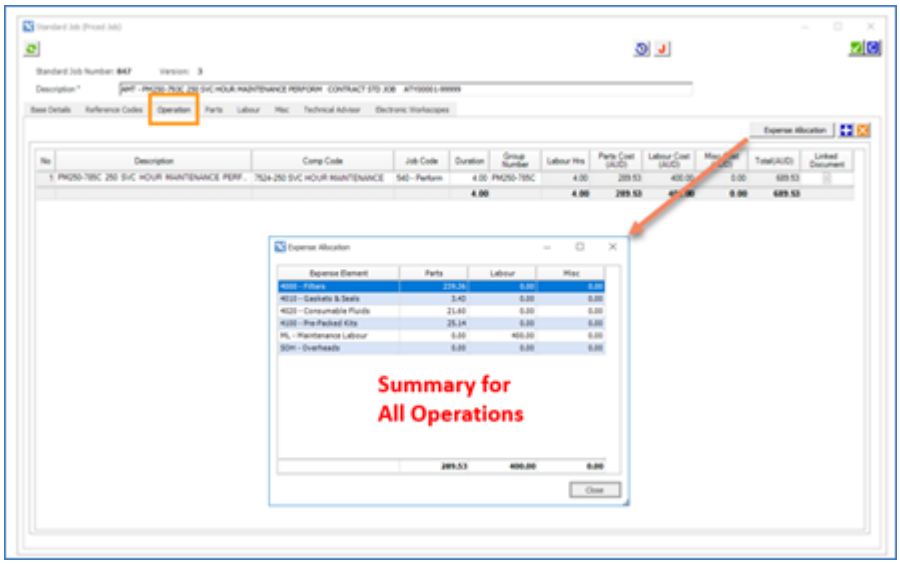

Modified Standard Job (Priced Job) - Misc tab

Expense Element column added to the grid.

Modified Standard Job (Priced Job) - Operation tab

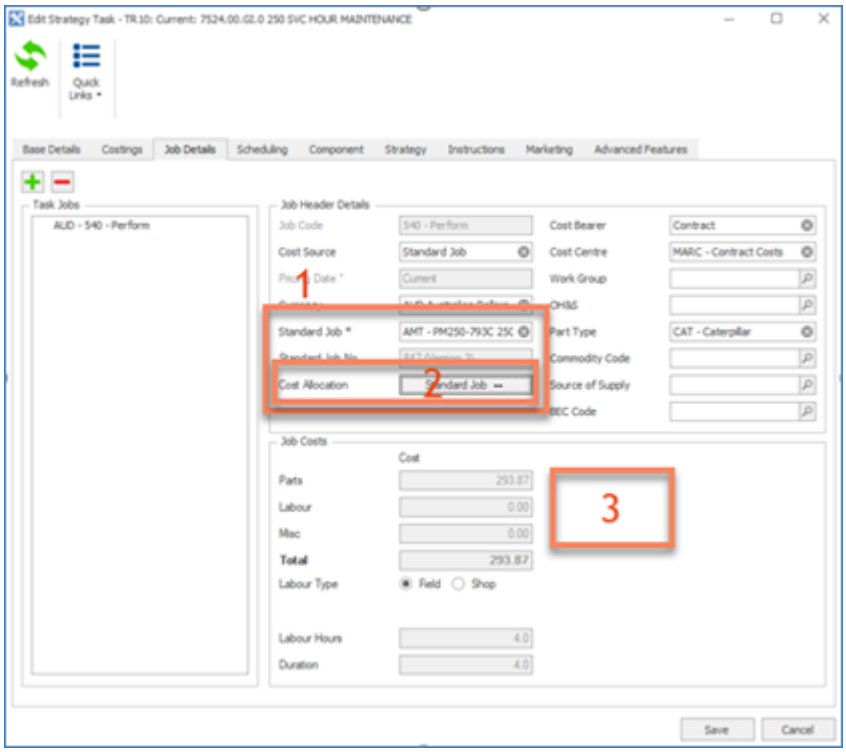

New **Expense Allocation** button displays when saving a Standard Job, when expense allocation has been enabled.

Selecting this button displays a summary of the expense element costs found in the parts, labour and misc tabs across ALL operations. The summary screen is not modifiable. If changes are required, these are made at the data source for example, within parts, labour or misc.

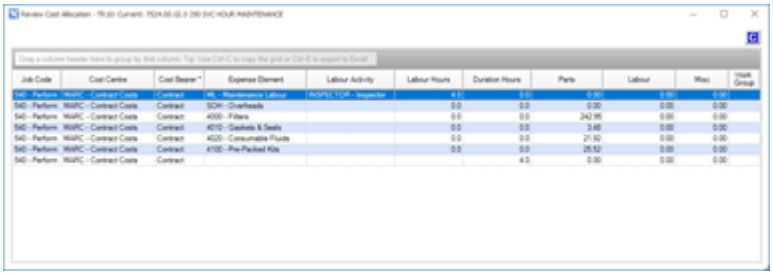

Modified Strategy Task screen

On the Strategy Task Task Job screen, when the user selects a Standard Job as the source, AMT will bring the Standard Job Expense Allocation through to the Strategy Task Task Job and build the cost allocation. Cost Centre (if recorded on the Task Job) or the Equipment Cost Centre will display on the Cost Allocation Screen. **No changes are allowed to the costs on the expense allocation**.

1. Selecting a **Standard Job** as source displays a **Cost Allocation** button which identifies a Standard Job cost allocation.
2. Selecting the **Standard Job Cost Allocation** displays the **Review Cost Allocation** screen populated with details from the Standard Job and Strategy Task/Equipment.

   a. The **Job Code** will default from the strategy task if entered on the strategy task job.
   b. The **Cost Centre** will default from the strategy task task job if a cost centre has been entered. If not entered, it will default from the equipment record.
   c. The **Work Group** will default from the strategy task task job if a work group has been entered. This is not a mandatory field.
   d. The **Cost Bearer** will default from the strategy task task job if a cost bearer has been entered. This is not a mandatory field.

e. **Labour Activity** will default from the standard job if a labour activity has been entered. This is not a mandatory field.

f. **Labour Hours** will default from the standard job if labour hours have been entered. This is not a mandatory field.

g. **Duration** will default from the standard job if duration has been entered. This is not a mandatory field.

h. **Expense Element** will display information from the Standard Job Expense Allocation. This is a mandatory field.

i. **Parts value** will display from the Standard Job Expense Allocation with its associated expense code.

j. **Labour value** will display from the Standard Job Expense Allocation with its associated expense code.

k. **Misc value** will display from the Standard Job Expense Allocation with its associated expense code.

3. When the job cost source is **Standard Job**, the expense elements in the **Job Costs** sections on the **Job Details** tab will be hidden and not available.

Business Rules

1. When an expense element is referenced on a standard job expense allocation it cannot be deleted in the system table. It needs to be made inactive for auditability and data integrity.
2. Inactive codes will not display in drop-down lists for selection.
3. If a labour activity is referenced on a standard job, it cannot be deleted without first being removed from the standard job.
4. A labour activity cannot be deleted if it has been used and references actual costs. It need to be made inactive for auditability and data integrity.

System Administration > System Tables

New table - Maintenance Order Type

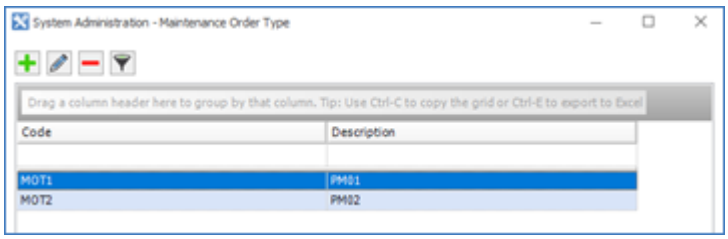

Menu location: **System Administration** > **System Tables** > **Maintenance**

Background

Currently Task Type and Maintenance Type co-exist in AMT but tying Maintenance Type to Task Type is not an efficient process when it comes to analysis by maintenance type. For example, not all component changeouts occur as preventative maintenance, and having multiple code combinations in order to analyse changeout work isn't always a suitable configuration.

The **Maintenance Order Type** (MOT) system table will allow maintenance types or different ERP order types to be appropriately defined, maintained and associated with strategy tasks.

The new table is called Maintenance Order Type rather than Maintenance Type as a Maintenance Type table already exists. The existing table and its current functionality remain. For new and upgrading customers, the use of MOT table is optional and is mutually exclusive to any existing configuration.

Maintenance Order Type Table

New database table: dbo.MAINTENANCE_ORDER_TYPE.

Attributes:

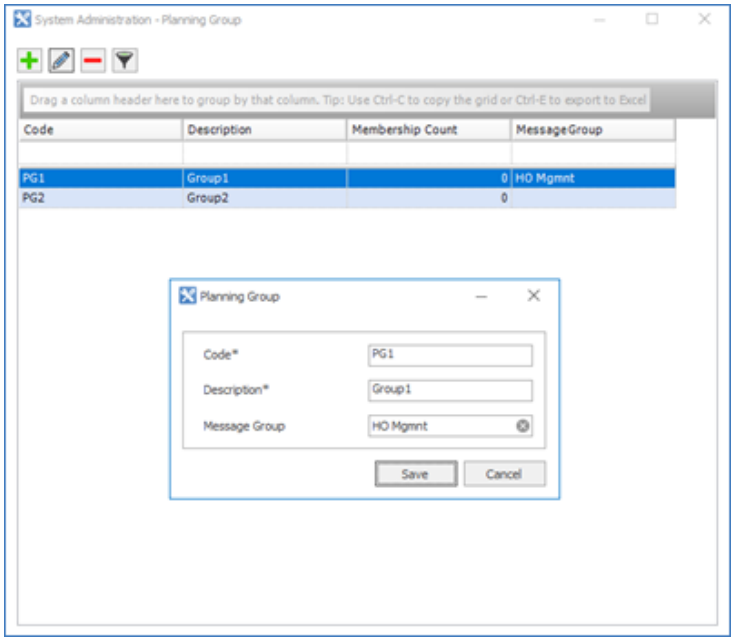

1. Code.
2. Description.

New table - Planning Group

Menu location: **System Administration** > **System Tables** > **Maintenance**

Background

AMT has not previously recognised a Planning Group for planning and work management purposes. A Planing Group is a person or group of people that organise maintenance activites.

Planning Group table

New database table: dob.PLANNING_GROUP

Attributes:

1. Code.
2. Description.
3. Message Group.

The **Membership Count** column is dynamically built. It queries the number of AMT Users that have been referenced with the Planning Group codes.

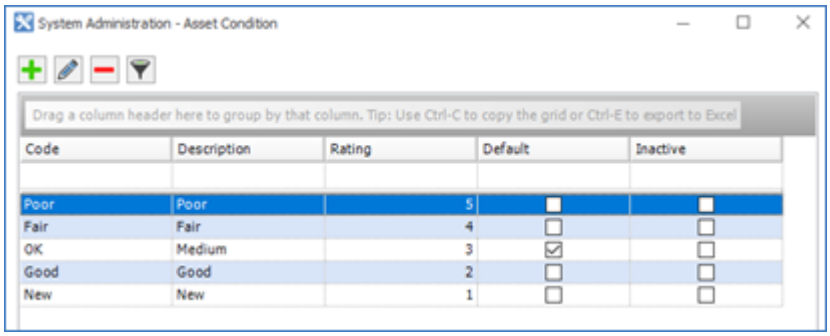

Message Group, an optional field, is used to support the new notification processes withing Budgeting & Forecasting (see Budgeting & Forecasting Approval Process). It requires Message Groups and email to be configured in AMT. Please refer to Customer Support or an AMT Consultant if you want to implement this functionality.

New table - Asset Condition

Menu Location: **System Administration** > **System Tables** > **Equipment**

Background

Asset Condition is a new table introduced into AMT to identify risk within planning and budgeting processes (see Risk Management). It is not mandatory to configure and can be used to identify asset condition without any risk rating calculations. However, if risk rating and ranking are required, the table must be configured and appropriate ratings for each condition provided that will suit your organisation's risk profile calculation.

Asset Condition table

New database table: **dbo.ASSET_CONDITION**

Attributes:

1. Code.
2. Description.
3. Rating.

4. Default.
5. Inactive.

Inactive flags allow customers who may wish, in the future, to restructure their asset condition strategy and codification.

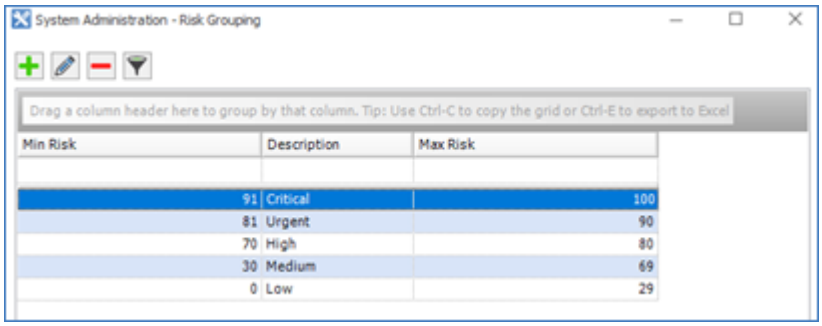

Rating supports a 1 to 10 ranking.

New table - Risk Grouping

Menu location: **System Administration** > **System Tables** > **Other**

Background

Risk Grouping is a new table introduced into AMT to identify risk within planning and budgeting processes (see Risk Management). It is not mandatory to configure. However, if not configured, risk calculations based on Equipment Criticality, Asset Condition and Operational Criticality cannot populate the columns for Risk Rating and Risk Rating Override within Long-term Planning and Budgeting & Forecasting.

Risk Grouping table

New database table: dbo.RISK_GROUPING

Attributes:

1. Min Risk.
2. Description.
3. Max Risk.

Risk Grouping allows the identification of risk ‘bands’ or groups that represent a percentage. The maximum risk cannot be greater than 100 and risk bands cannot overlap one another.

Four equal risk bands would be configured as follows.

Min Risk	Description	Max Risk
0	Low	25

Min Risk	Description	Max Risk
26	Moderate	50
51	High	75
76	Critical	100

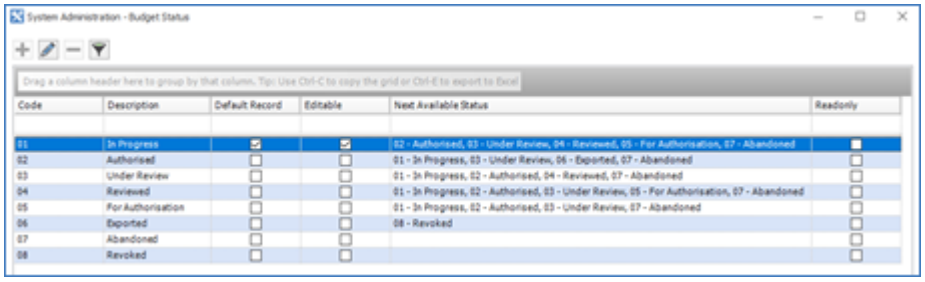

New table - Budget Status

Menu location: **System Administration** > **System Tables** > **Financial**

Background

Budget Status is a new table introduced into AMT to support both a budget status display progression and budget authorization process.

The table supports whether the budget details can be updated and the next workflow steps available to the user. This table is used in conjunction with AMT User configuration which enables whether the user has any nominated budget status access and to what level (see Budgeting & Forecasting Approval Process).

Budget Status table

New database table: dbo.BUDGET_STATUS

Attributes:

1. Code.
2. Description.
3. Default Record.
4. Editable.
5. Next Available Status.
6. Read Only.

All statuses are delivered with Read Only Status but this check box can be modified.

Not all delivered statuses are mandatory to use in any approval process.

In Progress (Budget_Status_Id = 1) and **Authorised (Budget_Status_Id = 2)** must remain as the first codes in this table as they align with the previous AMT version statuses of **Editable** and **Locked** which were not previously provided with a system table UI but whose logic existed in the database and within the code base.

One record (usually the first record in the approval process, for example **In Progress**) should be set at the default. This is the record which defaults to all new budgets created.

Best business practice would only make **In Progress** and **Under Review** statuses as editable.

Next Available Status is provided as an out-of-the-box recommendation if all statuses are used. As stated previously, it is not mandatory to use all statuses and if not used, the **Next Available** options should be adjusted accordingly (see Budgeting & Forecasting Approval Process).

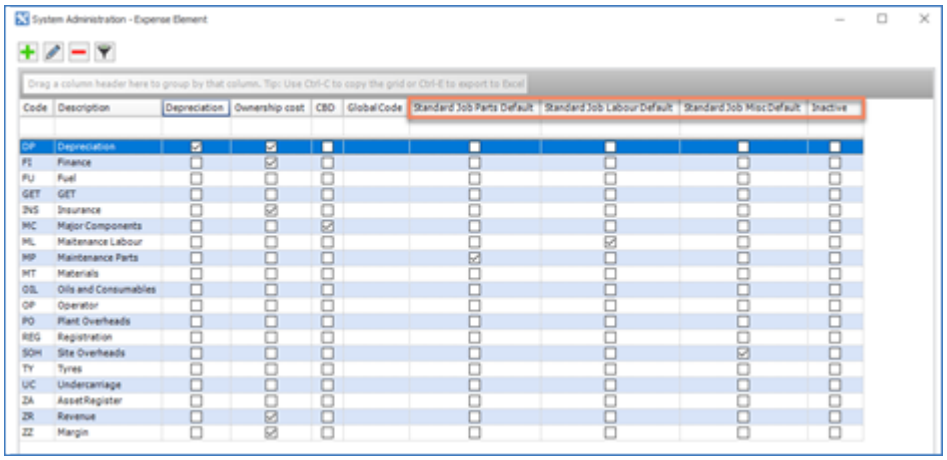

Modified table - Expense Element

Menu location: **System Administration** > **System Tables** > **Financial**

Background

To support the recognition of expense allocation costs that default from Standard Job through to the Strategy Task and Budgeting process, expense element defaults for parts, labour and miscellaneous have been introduced into the Expense Element System Table.

The default expense element will be used for any part, labour activity or miscellaneous category unless that part, labour activity or miscellaneous category has an expense element specifically configured.

Expense Element table

Database table: dbo.COST_EXPENSE

Added Attributes:

1. Standard Job Parts Default.
2. Standard Job Labour Default.
3. Standard Job Misc Default.
4. Inactive.

The **Inactive** attribute allows System Administrators to manage codes that may previously have been used but chart of accounts restructures or new ERP implementations have transpired. AMT's ability to delete codes historically could easily cause data integrity problems. Inactive codes will not display in AMT screen drop-down lists when creating new records.

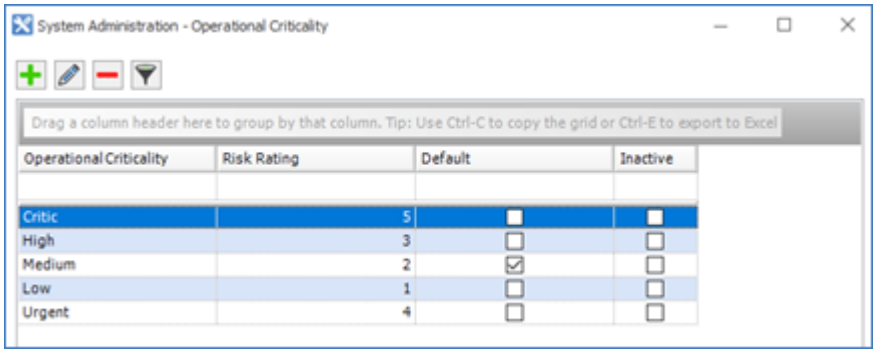

At least one code needs to be set as default for each of parts, labour and miscellaneous if the **Standard Job Expense Allocation** is enabled. While the same code could be set to be the default for all parts, labour and miscellaneous, this would be unusual.

Modified table - Operational Criticality

Menu location: **System Administration** > **System Tables** > **Maintenance**

Operational Criticality has previously existed within the AMT Database but without a System Table UI. Operational Criticality forms part of the new AMT risk identification calculation within planning and budgeting processes (see Risk Management) and new attributes have been added to the table.

Changing the configuration for existing (upgrading) customers is not mandatory unless they wish to use the new risk calculation and identification process.

Operational Criticality table

Database table: dbo.OPERATIONAL_CRITICALITY

Added Attributes:

1. Risk Rating.
2. Default.
3. Inactive.

A **Default** code setting will allow that code to be used when creating records. It is not mandatory.

An **Inactive** flag allows previously configured codes to be used by customers to remain for data integrity purposes if they do not support any new coding structures required for risk identification purposes. Any inactive codes are not available for selection when creating new records.

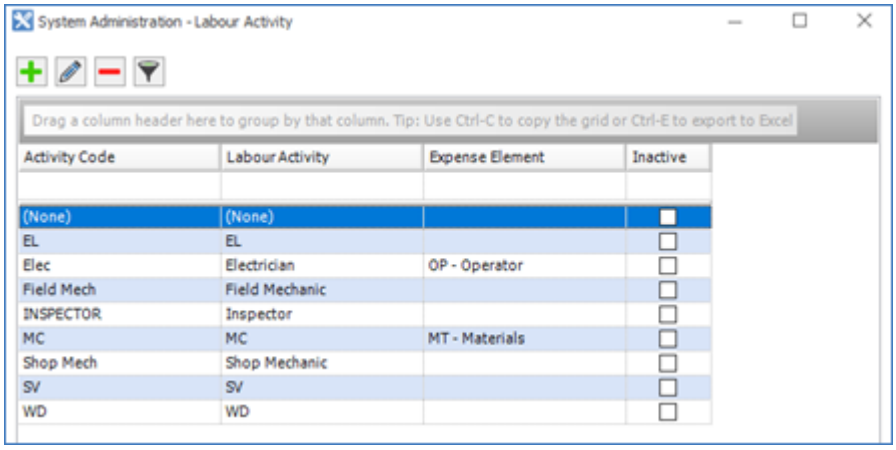

Risk Rating allows a ranking of 1 to 5 to be associated with a code to support the risk calculation and subsequent risk ranking process.

Modified table - Labour Activity

Menu Location: **System Administration** > **System Tables** > **Parts & Standard Jobs**

Background

To support Standard Job Expense Allocation and data integrity, new attributes have been added. Labour Activity can have an expense element specific to that labour activity if it is different to the default Standard Job Labour expense element configured on the Expense Element System Table. Inactive flags ensure data integrity which deleting records can cause.

Labour Activity table

Database table: dbo.tblLabourActivities

Added Attributes:

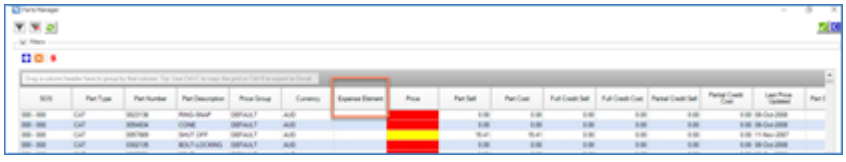

1. Expense Element.
2. Inactive.

Modified table - Parts Manager

Menu location: **System Administration** > **System Tables** > **Parts & Standard Jobs**

Background

To support Standard Job Expense Allocation and data integrity, an expense element specific to the part has been added if this expense element is different to the default Standard Job Parts expense element configured on the Expense Element System Table.

Parts Manager

Database table: dbo.tblParts

Added Attribute:

- Expense Element.

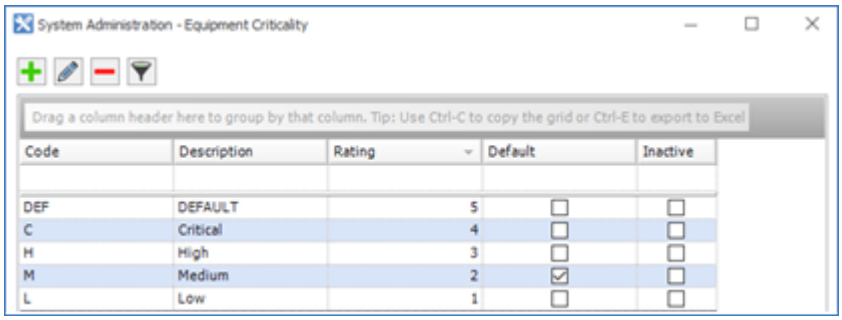

Modified table - Equipment Criticality

Menu location: **System Administration** > **System Tables** > **Equipment**

Background

Equipment Criticality forms part of the new AMT risk identification calculation within planning and budgeting processes (see Risk Management) and new attributes have been added to the table.

Changing the configuration for existing (upgrading) customers is not mandatory unless they wish to use the new risk calculation and identification process.

Equipment Criticality Table

Database table: dbo.EQP_CRITICALITY

Added Attributes:

1. Risk Rating.
2. Default.
3. Inactive.

Risk Rating allows a ranking of 1 to 5 to be associated with a code to support the risk calculation and subsequent risk ranking process.

A **Default** code setting allows that code to be used when creating records. It is not mandatory.

An **Inactive** flag allows previously configured codes used by customers to remain for data integrity purposes if they do not support any new coding structures required for risk identification purposes. Any Inactive codes are not available for selection when creating new records.

New table - Regulatory Code

Menu Location: **System Administration** > **System Tables** > **Maintenance**.

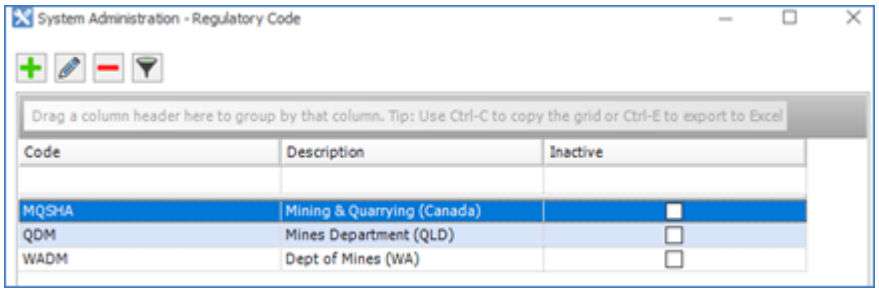

Background

AMT Work Order Operations already have both an OH&S Indicator at the header level and an S&E indicator at the operation level. These indicators use the HEALTH_SAFETY database table. This table was also used to identify ‘statutory’ or ‘regulatory’ compliance codes which was not ideal.

A new table (**dbo.REGULATORY**) has been introduced to identify different legislative or regulatory compliance applicable to a work order. Only one code can be held against the work order header.

Enablement

When defining the codes in the **Regulatory** table, it could be a simple Yes or No code or more logically it could be codes representing the reporting compliance to different statutory bodies. If identification is needed on a work order to cover multiple statutory bodies, a code would need to be defined to support this.

Regulatory table

New database table: [dbo].[REGULATORY].

Attributes:

1. Code.
2. Description.
3. Inactive.

New table - Delivery Method

Menu Location: **System Administration** > **System Tables** > **Parts & Standard Jobs**

Background

Delivery Method allows a customer to nominate the method by which a part is preferred, or needs in a special circumstance, to be delivered to site. This delivery method can be used to identify the urgency with which a part is delivered to site.

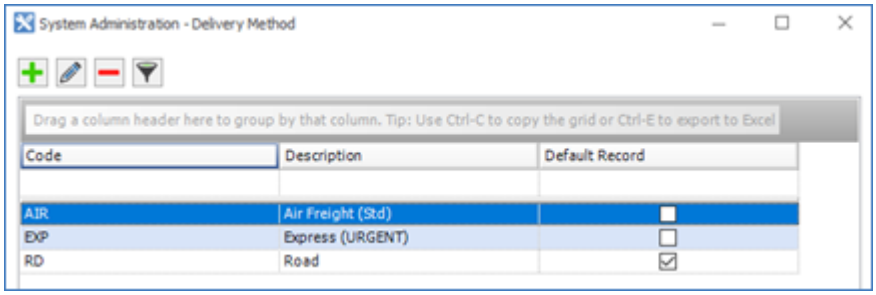

Enhancements

- **New database table**: [dbo].[DELIVERY_METHOD].
- **New Delivery Method attribute** on PURCHASE_ORDER database table.

- **New column** in Purchase Order (Stores Requisition) in Work Order Planning tab

Enablement

Define the required number of delivery methods and identify what is the most common (default) delivery method.

Delivery Method table

New database table: [dbo].[DELIVERY_METHOD].

Attributes:

1. Code.
2. Description.
3. Default Record.

New table - Operation Work Status

Menu Location: **System Administration** > **System Tables** > **Maintenance**

Background

With the advent of mobile processes, the Work Order Operation becomes more fundamental to the work activity assignment and completion. Operations on a single work order can be completed by different work groups independently and at different times. Overall, the work order controls whether the work is complete or not.

AMT must support the ability to assign, complete and confirm work at the work order operation level for the AMT Mobile solution.

Enhancements

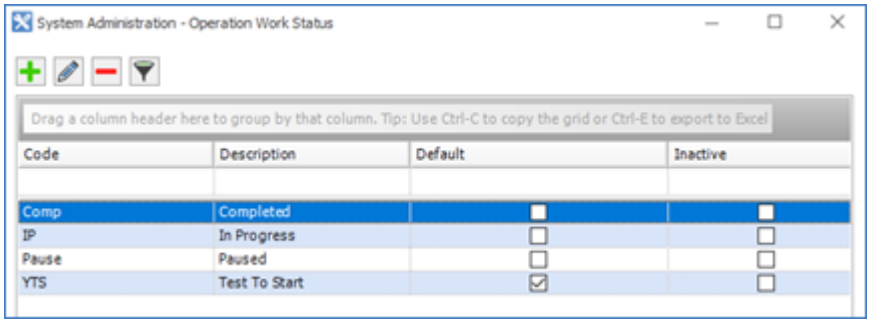

New Database table: [dbo].[OPERATION_WORK_STATUS].

Operation Work Status will be updated automatically from AMT Mobile processes.

Operation Work Status is not a mandatory field in the AMT Client. It can optionally be manually updated by users if they choose the field.

Operation Work Status (in this AMT v8.23 release) works independently of the Work Order Header Status. This business rule supports AMT Mobile for SAP, where SAP controls the status update at the work order header.

Enablement

Operation Work Status table

New database table: [dbo].[OPERATION_WORK_STATUS].

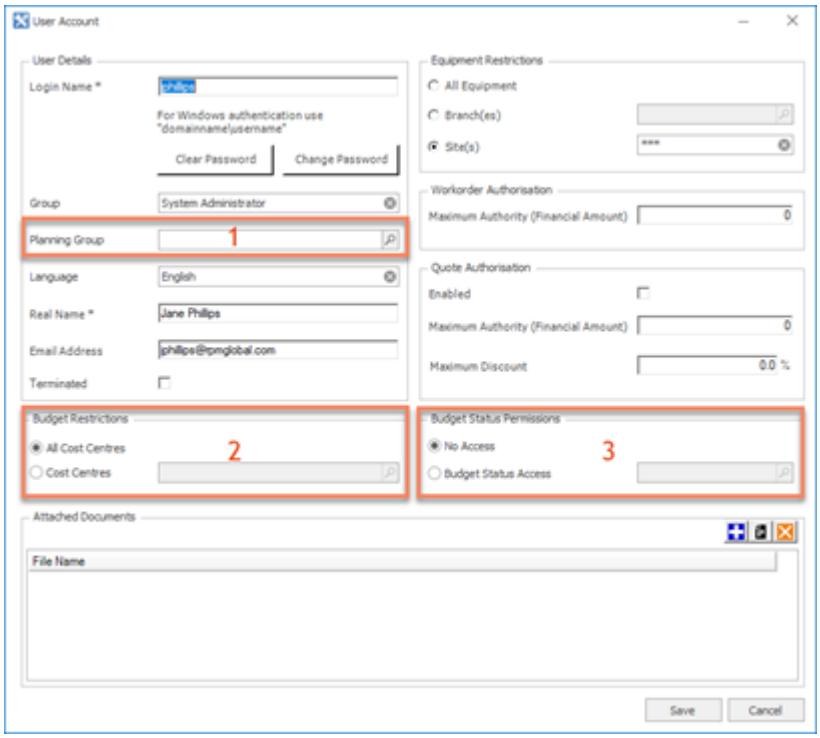

Attributes:

1. Code.
2. Description.
3. Default Record.
4. Inactive.

System Administration > User Profiles

Modified screen - AMT User Accounts

Menu Location: **System Administration** > **User Profiles** > **User Accounts**

Added Attributes:

1. Planning Group.
    - An AMT user can be part of one or more planning groups.
2. Budget Restrictions (by Cost Centre).
3. A labour activity cannot be deleted if it has been used and references actual costs. It needs to be made inactive for auditability and data integrity.
    a. By default, an AMT user has no access to modify the budget status field in the Budget Header. The field is disabled for editing with this configuration for this user.
    b. Budget Status Access, when granted, involves both access to the field but also access to the field depending on the current budget status when compared with the user's budget status permissions.

System Administration > Organisation

Modified screen - Employee

Menu Location: **System Administration** > **Organisation** > **Employee**

Background

A requirement for AMT Mobile 2.0 is the both the ability to check employee qualifications that may differ across sites, and removal of the constraint found in existing AMT Mobile 1.0 where employees were required to confirm

their site access (Employee and Pin) each time they move to a different process.

Enhancements

AMT Users can now be linked to Employees. This is optional but will be required when AMT Mobile 2.0 is available for deployment in an upcoming release. Additionally, the need to identify fictitious employee numbers (for uniqueness) per site has been removed.

Modified screen: **System Administration** > **Employee**

New screen: **Employee Sites**

Enablement

During the upgrade process, new tables that store the relationship between existing employee records and sites are created and populated with default values drawn from the existing Employee records. Note the following limitations:

1. The upgrade process cannot determine which Employee should be associated with which AMT user. This is a manual process for an AMT administrator to perform post upgrade using the new Employee/User association feature.
2. The upgrade process cannot consolidate duplicate Employee records, that is, multiple Employee records that represent the same physical person. The AMT **Health Check Script** has been extended to identify potential duplicate Employees. AMT administrators can work with RPM Global Customer Support to use this script to identify potential duplicate employees. Once identified, AMT administrators must use the existing Employee management facility to consolidate duplicates as appropriate.

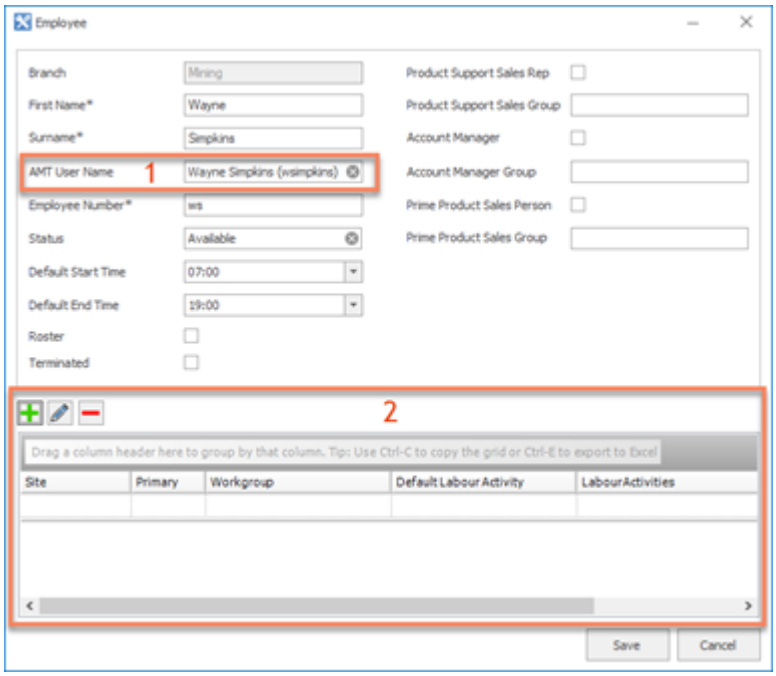

Post upgrade, a review should be undertaken to ensure Employee records accurately represent the sites and roles on those sites the employee is associated with.

Business Rules

- One, and only one, AMT user can be associated with an Employee.
- An AMT user can only be associated with one Employee.
- Employee Site access configuration is dependent on AMTUuser Equipment restrictions.
- The Work Group associated with the primary site will represent the employee's default work group.
- There can only be one primary site at any one time.
- Employees may have the same or different labour activities at different sites, for example, **ELEC Class A** at Site 123, and **ELEC** at Site 456.

Modified screen - Employee

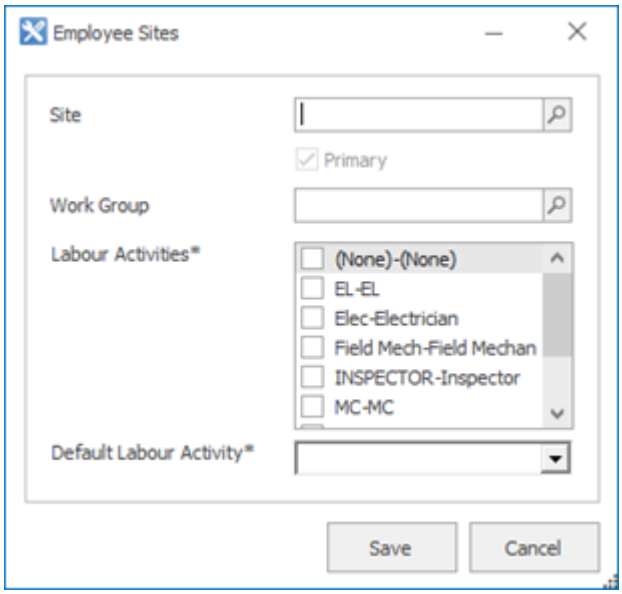

The layout of this screen has changed to support a new process of identifying employees with sites that does not involve giving the same employee on each different site a different employee number.

1. Added **AMT User Name**.
    a. Validates against the AMT user.
    b. Unlinked AMT users will display in a list.
    c. Will display the **Login Name** in brackets to distinguish two different users who may have the same name.
2. New grid section, which displays the results of sites to which the employee has been given access together with work group and labour activities. Icons to **Add** and **Edit** launch a new **Employee Sites** screen.

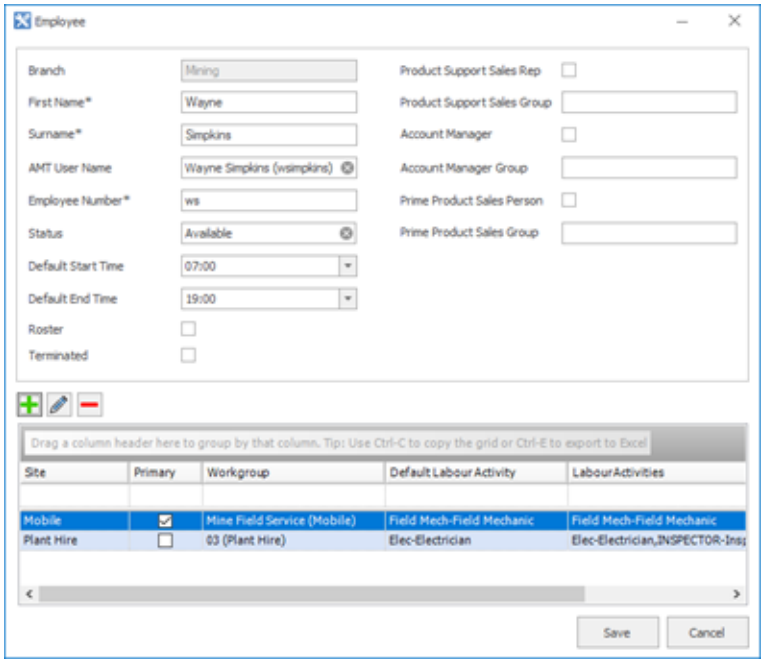

New screen - Employee Sites

This screen supports the nomination of site access, work group and labour activities.

- **Site** - select site from list.
- **Primary** - if multiple sites are defined, one site must be selected as the primary site. It is the primary site that is used for labour availability calculations.
- **Work Group** - select from work groups associated with the site.
- **Labour Activities** - one or more labour activities can be selected.
- **Default Labout Activity** - on labour activity is nominated as the default. The first labour activity selected will automatically populate as the default, but this can be modified by selecting the drop-down list.

Once completed, the Employee screen looks like the example below.

Performance updates and Optimisations

- **Functional Location (FLOC)** Manager has been modified to observe the max records setting and will display a message box in FLOC Manager if the number of results exceeds that limit. Functional Location linking process has been improved.
- Staging tables have been introduced into **Budgeting & Forecasting** to improve overall budget performance. In previous versions, changes to budgets and budget recalculations were performed directly within the budget database tables. This could lead to poor performance when multiple simultaneous budget operations were performed. By using staging tables, compute-intensive operations are moved away from the primary database, resulting in less database contention and better performance.
- **AMT Health Check** has been modified to show a message where there are strategy tasks without jobs.
- **Process Financial Summary Performance** has been re-engineered to improve the overall efficiency of the work order settlement/financial summary process.
- The Equipment load process has been optimized on **AMT Client** start up.
- The filtering and opening strategy task processes in **Edit Equipment** have had performance improved.
- **Standard Job Load** has been indexed.
- **DoNotOverwriteOverduePlanningTargetDates** in **AMT_TYPED_VARIABLE** has been deprecated. This legacy setting was implemented for a specific use-case for a customer in the past and was deemed to be unstable. It was considered experimental, and never supported.
- **DLCC Performance - Projection Batching**

  In previous versions, the DLCC process could adversely impact performance if a significant number of projections had to be calculated. Likewise, other processes could interrupt the DLCC process if the system determined it had been running for too long. In this release, DLCC now supports **Projection Batching**. Projection Batching means the DLCC processes projections in batches (instead of a single, potentially very large batch). This means that each batch can be processed more quickly, releasing resources back to the system more frequently. This lessens overall pressure on the system, and means the DLCC process is less likely to be paused so that other, higher priority processes, can be executed.

  A new configuration, **DLCCBatchSize** will hold the maximum number of projections DLCC can process. If there are more projections to calculate than the maximum number, DLCC will take only the DLCCBatchSize into calculating. The remainder will be postponed until the current batch has finished, at which time it will automatically move the new batch into calculating. DLCC will move projections into batches in order. Projections with flags that are the earliest will be processed first.

  A new **calculating pending** status will be assigned to projections which are waiting to be calculated. The new calculation status will differentiate between quarantine for faulty projections and pending calculations.

  Recalculation Manager displays the Pending status in the grid. Form filters have been modified to support **Quarantined** and **Pending** statuses.

  Projection Calculation Status Table

New	Description	Database Ordinal Value
OK	Calcualation is not required for projection	0
Required	Calculation is required for projection	1
Calculating	DLCC is calculating the projection	2
Queued	Projection is queued; waiting for calculation	3
Quarantined	Projection is quarantined	4
Pending	Projection is waiting; to be calculated in the next batch.	5

- **DLCC Performance - Auto Quarantine Rules**

  The following auto quarantine rules have been introduced into the DLCC calculation process.

  - Automatically quarantine projections if a parent task does not have a component structure linked.
  - Automatically move projections into quarantine if end usage or date cannot be calculated. Error message, date and time of quarantine are recorded in the RECALC_POSTPONED database table.
  - Automatically quarantine projections if AMT schedules multiple occurrences of a strategy task with the same date.

- **DLCC Performance - Other changes**
  - Improved performance of REP_PROJ_COST_UPDATE_P.
  - Calculating flags and quarantined flags within DLCC calculation have been moved to a new flags table.
    - When upgrading, Customer Support must stop AMT calculation and interface services.
    - Some data may remain in a calculation state and these calculations will need to be finished **after** the database is upgraded.
    - In order to finish, the flags need to move into the new flags table.
    - Similarly, for any quarantined projections - all quarantined flags need to be moved into the new quarantined flags table.
  - usp_Update_RepActualCosts_EqpProj has been removed from Recalc. It has been replaced with a view with the same name.

    - Reports that rely on this are:
        - Cash Flow Statement.
        - Cash Flow Chart.
        - Contract Reconciliation.
        - Contribution Summary.
        - Equipment Cash Flow Chart.
        - Equipment Performance.
        - GM Comparison Chart.
        - GM Comparison.
    - **These reports should be tested pre- and post-upgrade**.
- **Other Performance Adjustments**
    - Settlement processing in Recalc - speed improvements.
    - Import Next Due performance improvements.
    - AMT Client Code Signing improvement.
    - AMT Code Signing Certificate updated.
    - AMTServer Diagnostic Log has been disabled.

Fixes

Functional Area	Fix	Work Item
Actual Usages	The performance of delete actual usages has been optimised.	44412
Analysis Services	**IC extraction** no longer fails if the code page size is too small to accommodate some languages.	33716
Budget and Forecasting	Two fields, **End Usage** and **Maximum End Usage** have been removed from the **Budget Equipment Editor** because they were irrelevant to this screen.	40981
	Fixed an issue where the **Edit Status** drop-down list was popping up an empty list on the **Budget Header Manger** screen and the form could not be saved.	42320
	Budget system tasks are no longer being executed in the wrong order.	44376
	On the **Budget Revenue** form, copying the values from an Excel sheet to the grid on the screen no longer excludes some columns and rows.	36478
	On the **Budget Header Manager** form, the description for the **Project Manager** selection panel is now being displayed correctly.	32433
	In the **Budget Forecast Manager**, in all tables, copying data from Excel no longer excludes some columns and rows.	37713
	In the **Budget Module** the **Budget Task Description** no longer shows the wrong information after task identifier codes are changed in the original strategy task.	41812
	When adding equipment to the budget in the **Budget Equipment Manager**, the error message "System error occurred, the process may not be successful" is no longer shown.	41609
	Fixed the **Component Status – Suppression Impact** report to align with the same parent suppression logic as occurs for Life to Date suppression calculation in Long Term Planning.	29361
	When generating a budget, an error message displays when the AMT maximum records variable setting is exceeded.	42214

Functional Area	Fix	Work Item
Budget & Forecasting	Performance improvements have been made to the budget execution	43409
	System task created when deleting an entire budget. The budget will be deleted entirely when the system task finishes calculating at which time refreshing the display grid will remove the budget from the grid. While a budget is being deleted, a user will not be able to edit or recalculate it.	43412
	Fixed the **copy table** function in **Labour Hours Manager**, which is used to transfer data from the grid to Excel.	43670
	After strategy task information is updated consistently, the updates are applied across budgeting reports and screens.	40537
	A new **Budget System Task Status** screen has been changed. Users now need to close the screen before they can use other budget features. **Budget Forecast Manager** will automatically refresh on closing the **Budget System Task** screen.	44607
Condition Based Maintenance	In the **Condition Based Maintenance** process, notifications are no longer triggered if the failure mode is **TREND**.	32965
Daily Operations	Supervisor Approved Filter added to **Timesheet** screen. Supervisor Approved Filter added to **Timesheet Cost Analysis Report**.	38504
Daily Planning	You can now select **Simple Planing** equipment in the filters of the **Daily Planning** > **Equipment Down** tab.	33873
	In the **Planning Screen**, the **Work Order Editor** can now be opened even if event actual down time is empty (YTS) and the work order has negative actual offset.	33313
	Fixed an issue where Purchase orders could not be created in the **Planning** screen because of mismatches between different column sizes. Restrictions have also been applied to each of the free text columns in both **Purchase Order Grid** on **Work Order Editor** screen and **Purchase Order Editor** screen to avoid data truncation.	33733
	Fixed an issue in the **Planning** form Backlog section where copying a backlog workorder excluded the SOS field.	36433

Functional Area	Fix	Work Item
Daily Planning	In the **Planning Screen**, the **Work Order Editor** can now be opened even if event actual down time is empty (YTS) and the work order has negative actual offset.	33313
	Fixed an issue where Purchase orders could not be created in the **Planning** screen because of mismatches between different column sizes. Restrictions have also been applied to each of the free text columns in both **Purchase Order Grid** on **Work Order Editor** screen and **Purchase Order Editor** screen to avoid data truncation.	33733
	Fixed an issue in the **Planning** form Backlog section where copying a backlog workorder excluded the SOS field.	36433
	In the **Planning form > Planning** tab the grid now sorts properly on the CompletedOn date column.	37670
	In the **Planning** screen, clicking the **Create ERP WO** button no longer results in an error if AMT is configured to use **PO Mode** and **Choose_WO_Date**.	40387
	In the **Planning > Events** tab, after creating an Event from a backlog, the priority of the related workorder is no longer changed to the priority of the added event.	40100
	In the **Workorder Authorization** form, collapsing the filter section at the top of the form now properly expands the form so more of the grid can be seen.	40874
	Equipment are now being correctly grouped in Scheduling.	39440
Dashboard	Fixed an issue in the **AMT Dashboard** where the **Availability** widget reported against the 'Dealer' responsibility only. In this release, the calculation has been changed to report against the default responsibility.	33704
Data Models	Fixed an issue in the **Inspection data model** where the inspection start and end time were incorrectly returning empty values. This issue would manifest as missing start and end dates in the AMT Mobile Inspection module.	36277

Functional Area	Fix	Work Item
Data Models	Fixed an issue in the **Inspection data model** where the inspection start and end time were incorrectly returning empty values. This issue would manifest as missing start and end dates in the AMT Mobile Inspection module.	36277
Depreciation	It is now possible to add a depreciable asset to a capital asset if the capital asset contains transferred depreciable assets.	32900
	Fixed an issue where, under some situations, depreciable assets could not be transferred.	32623
	Depreciation is now calculated correctly even if actual usage has not been entered for an extended period of time.	36228
	Disposal of a depreciable asset now considers the impairment value.	32946
DLCC	PM Services now correctly calculates its next occurrence.	33239
	Fixed an issue where recalc was skipping equipment and causing work order settlements to link incorrectly, by quarantining projections with duplicate occurrences.	43935
Equipment	**Actual Cost** for the current projection is now on **Edit Equipment > Task Tab**.	42206
	It is now possible to add multiple projections to Centerline equipment.	35922
	In the **Depreciable Asset Manager**, impairment values are now reversed during the asset disposal process, and revalauation values are now reflected in the asset transfer process.	33033
	Fixed an issue where, under some conditions, an alternate projection could not be added to a real equipment.	38400
	Adding an alternate projection to equipment no longer results in an error stating the projection name already exists.	38593
	Marketing data is included in the **Create Real Equipment from Modelling** process.	40202
Integration	Valid usages files can now be moved to the failure folder after import.	35513

Functional Area	Fix	Work Item
Integration	Fixed an issue in the **Work Order Import** process where the Task Instruction field was truncated to 1000 characters from 8000 characters.	35516
	Fixed an issue where creating a strategy task from a standard job would create a strategy task with a blank description. In this release, the standard job description is copied to the strategy task. If the standard job description exceeds 100 characters (the limit of a strategy task description), the first 97 characters are copied, followed by three periods '**...**'.	36697
	Fixed an issue in the **Import Standard Job** process where a blank UOM value was converted to the default UOM. In this version blank UOM's are left as-is, and the standard job is interpreted as a date-based job.	36053
Long-term Planning	Fixed an issue in **Long Term Planning - Shutdown Planning** where an error could occur while trying to assign a maintenance point due to the number of occurrences exceeding the maximum allowable limit.	43404
	A specific filter combination in **Long-term Planning** no longer displays the error 'Error converting data type varchar to float'.	39903
	Fixed an arithmetic overflow error that caused a filter issue on **Long-Term Planning – Shutdown Planning**.	41816
	Fixed an issue where projected occurrences within a parent suppression group were missing after replanning.	43700
KPI Calculations	Fixed an issue where downtime calculations were not calculating and rounding correctly.	41468
Microsoft Project Export	The grouping of exported data in **Export to Microsoft Project** is now consistent.	35169
Planning	Fixed an issue in the **Planning** form where an incorrect window title was shown when adding a backlog workorder from strategy task. The title now displays 'Create workorder from unplanned strategy workorder'.	32767

Functional Area	Fix	Work Item
Reports	Fixed an issue in the **Functional Location Cost Analysis Report** where the toggle parameter was taking too long to load, ultimately freezing the form.	35763
	In the **Changeout Analysis - Detailed Report** the invalid value of 'NONE' is no longer shown in the **Review Status** column.	41562
	Fixed an issue in the **Cost Per UOM Report** where, when negative accrual was enabled, the report displayed the standard strategy task amount, not the adjusted amount.	40555
	Fixed an issue where it was possible to select multiple projections in the **Cost Per Interval Report**, resulting in meaningless values. You can now select only one projection.	41941
	The error message 'The value provided for the report parameter 'StartDate' is not valid for its type.' no longer appears in the **RVIC Analysis Report**.	.37038
	Fixed a performance issue in **Daily Machine Performance Check Sheet Report** that could cause the report to time out.	35491
	Fixed an issue in the **Cost Analysis- Life Cycle Report** that could result in an error under specific conditions.	42520
	In the **Equipment Evaluation - Summary Analysis Report** , the Cumulative UOM row no longer overlaps the Cumulative Costs row.	42149
	Fixed an issue in the **Maintenance Compliance Report** where no data would be returned if imported data used an unexpected character encoding.	36698
	The **Forecast Worksheet (Serial Number) Report** no longer becomes unresponsive after being displayed.	34145
	In the **Marc PCV Chart - @Cost Report** the requested start date and end date are no longer ignored.	42493
	The **Component History Report** now only displays the component code/strategy task detail applicable to the work order when triggered from the work order feedback screen.	41250

Functional Area	Fix	Work Item
Reports	Fixed a language issue which was causing an issue in the **RVIC Analysis Report** that impacted the **End** date and accuracy of the **Residual Value** displayed.	44241
	Fixed an issue with the **MARC PCV Chart - Cost** display.	42196
	Fixed an issue that occurredwhen the AMT maximum records variable was exceeded, and **<selected>** was displayed as the equipment filter. The **Equipment** filter will now display at least one equipment that had been selected.	42514
Shiftlog	Fixed an issue where users could accidentally book equipment in the future via Events in **Shitflog**. In this release, if a user sets the **Actual End Time** in the future and tries to save the event the following message appears: "Entering an Actual Up time with a date and time in the future may result in unexpected results in the schedule. Are you sure you want to continue?". The default option is **Cancel**. The user can still select **OK** to continue.	32842
Standard Jobs	Fixed an issue where the **Standard Job Editor form** could be truncated when viewed at certain screen resolutions.	36488
	In the **Standard Job Manager**, both the Task Type and the Job Code filters filter correctly.	32782
	In the **Standard Job Manager** , importing a standard job no longer results in the links between the job and its library documents, external documents and electronic workscopes being lost.	32714
Strategy Optimisation	Alternate projections copied from Current projections no longer have a cost difference in the strategy tasks scheduled on last scheduled.	43226
	In the **Strategy Task Analyser** , opening the Workorder Manager via the Quick Link no longer results in an incorrect number of occurrences relative to what is showed in the parent form.	36054

Functional Area	Fix	Work Item
Strategy Tasks	Fixed various issues associated with linking documents in the **Multi-Task Editor**.	42583
	The labour hours figure no longer doubles in the **Job Details** tab of **Edit Strategy Tasks** form.	41853
	Fixed an issue that could result in an error copying Strategy Tasks when specific combinations of data were duplicated.	41761
	It is now possible to select a projection after selecting a site or fleet in the **Multi Task Scope Editor**.	42186
	Fixed an issue where it was not possible to save a Repair Reserve task from the **Edit Strategy Task** screen if the parent task was not linked to the appropriate component structure. In this release, business rules have been relaxed to allow this to happen.	35052
	The **Save** button is now visible on the **Edit Next Due** in all resolutions.	36052
	After selecting a Site or Fleet, it is now possible to select a projection in the **Multi Task Scope Editor**.	42265
	In the **Edit Strategy Task** form, costs are now showing properly when the strategy task has multiple jobs and the **Refresh** button is clicked immediately after modifying one of the jobs.	41151
	Documents duplicated on strategy tasks can now be deleted.	42194
System Administration	Deleting a Task Type that is being referenced no longer results in an error.	42676
	Fixed an issue that could cause the **Update Planning from Strategy System Task** to fail.	34230
	In the **Fleet Administration** screen, selecting all part types in the filter now returns Fleets.	35648
	Fixed an issue in the **Labour Rate** system administration screen where labour rate was displayed using one decimal place. In this version, two decimal places are displayed.	34128

Functional Area	Fix	Work Item
System Administration	Deleting a Task Type that is being referenced no longer results in an error.	42676
	Fixed an issue that could cause the **Update Planning from Strategy System Task** to fail.	34230
	In the **Fleet Administration** screen, selecting all part types in the filter now returns Fleets.	35648
	Fixed an issue in the **Labour Rate** system administration screen where labour rate was displayed using one decimal place. In this version, two decimal places are displayed.	34128
	Fixed an issue in the **Group Permissions** where users with **View** permission were able to edit data in the **EQS Shiftlog Tab EQS Shiftlog Tab** of the **Planning** screen.	33417
System Task	Update Planning from Strategy System Task has been fixed and performs more efficiently.	33239
Work Orders	Fixed an issue in the **Workorder Settlement** screen where the **Open External Workorder** button was visible in scenarios where it should not be.	44368
	The **Workorder Settlement Manager** form no longer warns of currency conflicts for the selected sites when the sites have the same currency.	30509
	Fixed an issue where the value of the **Strategy** check box on the **Workorder Settlement Manager Grid** and the **Select from Strategy Task** radio button on the **Edit Workorder Settlement** screen did not show the same value in the Workorder Settlement.	33526
	Fixed a tab order issue in the **Workorder Settlement Manager > Workorder Settlement Details** tab and **Workorder Settlement List** area. Controls within Workorder Settlement Costs area and two buttons (**Save**, **Close**) can receive focus by clicking **Ctrl+Tab**.	35716
	Fixed an issue where documents linked to work orders could be duplicated.	32624

Functional Area	Fix	Work Item
Work Orders	Fixed an issue where duplicate Parts, Labour and Misc records could be created when work orders were created from strategy tasks. This occurred because cost allocations were not deleted while importing strategy tasks.	41682
	Fixed an issue where the Replanning System Task would fail to modify the planning mode of work orders to match the planning mode of the related equipment after a manual change to the equipment planning mode.	36487
	Fixed an issue where it became impossible to add parts to a work order where that work order is linked to a work order in an ERP. This could occur if two or more users attempted to create an ERP work order or purchase order at the same time. In this version, if a user (A) clicks the Create ERP WO or Create PO buttons from the work order, AMT detects if the ERP reference has been updated by user (B) since user (A) started editing the work order. If this scenario is detected, the following message is displayed: “Another user updated the ERP Work Order reference. The action has been cancelled and the work order will be refreshed with your changes and the updated ERP Work Order reference”.	33154
	Fixed an issue where the **Work Order Editor** screen could be truncated at lower screen resolutions. In this release, the client area of the Work Order Editor screen becomes scrollable if required. Note that automatically saved Work Order Editor screen settings (such as column widths) will need to be reset. This is an one-time operation.	33164
	The word Tolerance is now spelled correctly on the **Edit Workorder** screen.	35465
	Fixed an issue where a work order created from strategy task via a system task did not include a labour line if the job code was not defined in the strategy task.	33909
	Import Defects (via csv) will use the default work group (if one exists). **Import Defects (via csv)** has been modified to set the **Other Resources** flag in accordance with the interface file.	33871

Functional Area	Fix	Work Item
Work Orders	Fixed an error where the **Update Planning from Strategy** system task was not creating the work order settlement for the first work order in the list. This caused no work order number to display in **Workorder Editor**.	43669

Version Number 8.21 Update 2

The following is a list of all changes and updates addressed in AMT Version 8.21 Update 2.

Overview

The major changes between AMT Version 8.21 Update 1 and 8.21 Update 2 are as follows:

- Fixed false positive malware detection.
- Bug fixes in the following areas:
    - Labour Rates System Administration
    - Reports
    - System Tasks
    - Work Order ERP Integration
    - Work Order Editor

Functional Area	Fixes	Work Item
Client	Fixed a false positive detection of malware in the AMTClient.exe file.	36464

Functional Area	Fixes	Work Item
Integration	Additional safeguards have been added to the **Create ERP WO** and **Create PO** functions to reduce the likelihood of two users attempting to link an AMT Work Order with an entity in an ERP at the same time. In this release, when a user clicks Create ERP WO or Create PO, AMT detects if the ERP reference has been updated by another AMT user. If an update is detected, the following occurs: 1. An integrations message is NOT sent to the ERP. 2. The following message is displayed. *Another user updated the ERP Work Order reference. The action has been cancelled and the work order will be refreshed with your changes and the updated ERP Work Order reference.* 3. The Work Order user interface is refreshed to include the changes made by the other user, including the correct ERP work order details. If the user had clicked the Create PO button, the action will need to be performed again after the editor is refreshed with the ERP work order details.	33154
Reports	Fixed an issue where running web-based reports implemented using Crystal Reports technology would fail. This issue was caused by switching to native 64-bit mode. In this release, web-based Crystal Reports are run in 32-bit mode.	35420
	Drilling down through the **RVIC Analysis Report** no longer displays the message *The 'Translations parameter is missing a value*.	34047
System Admin	Fixed an issue where the **Labour Rate System Administration** screen displayed the **Labour Rate Per Hour** value to one decimal place (Actual values were stored using two decimal places - this was a display issue). In this release, Labour Rate Per Hour is displayed to two decimal places.	34123
System Tasks	The **Update Planning from Strategy Task** no longer fails to run if geolocation information has been stored against an asset.	34230
Work Orders	You can now see the entire **Work Order Editor** at the minimum supported screen resolution	33164

Version Number 8.21 U1

The following is a list of all changes and updates addressed in AMT Version 8.21 Update 1.

Overview

The major changes between AMT Version 8.21 and 8.21 Update 1 are as follows:

- Changes to AMT Transfer and Split process.
- Bug fixes in the following areas:
    - Depreciation
    - Failure Mode Analysis
    - Planning
    - Work Orders
    - Reports

Fixes

The following is a list of all issues resolved.

Functional Area	Fixes	Work Item
Depreciation	It is now possible to **split an asset** when the revalue amount is negative.	33693
	It is now possible to add a **depreciable asset** to a **capital asset** if the capital asset contains transferred depreciable assets.	32900
	In previous versions, assets that have only initial purchase transactions could not be transferred. In this version, assets can be transferred without restriction.	32882
	Fixed an issue that allowed an impairment value greater than the written down value to be applied.	33672
	The impairment value is now being accounted for when disposing of assets.	32963
	Impairment and revaluation values ar now considered in asset transfers.	33033
	Fixed an issue where the **Revalue Assets** screen did not allow both positive and negative values in the **Revaluation** field. This change ensures the written down value cannot drop below 0.	33666
Equipment	In this version, entering an **actual end time** in the future in an event will result in the prompt "Entering an Actual Up time with a date and time in the guture may result in unexpected results in the schedule. Are you sure you want to continue?" The default action is **Cancel**, but you can select **OK** to continue the save process.	32842
Failure Mode Analysis	Notifications are now generated for **Measurement Translation Rules** that use the **TREND <** condition.	33002
Planning	Fixed an issue where the next occurrence may not be calculated correctly when sibling supression was used.	33285
Standard Jobs	Fixed a filtering issue on the **Standard Job** editor where a null list of Job Codes was displayed when the **Budget Code** check box is cleared.	32782

Functional Area	Fixes	Work Item
Work Orders	Fixed an issue where filtering for work order settlements within a branch would sometimes result in the error message **Please select Equipment that have the same Site Currency and try again**, even if all the sites within the branch had the same currency.	32953
	Fixed an issue where, depending on the number of characters in the site address fields, the creation of the purchase order could fail when the work order was completed.	33773
IC Extracts	The IC Extract process no longer fails when the SQL Server database collation is configued as **Cyrillic_General_CI_AS**.	33724
Reports	In the **Changeout Forecast Worksheet** report it is now possible to override the default start and end dates.	33006
	An exception no longer occurs in the **Cost Cap Financial Summary** report when **Manufacturer** is selected as the **Group By** field.	32920
	Fixed various filtering combination exceptions in the following reports: • Cost Analysis - Life Cycle • Cost Analysis - "To Date"	31597
Reports	Fixed an issue where Ops Job Code filter did not return data if the Job Code started with zero (for example, 038), and another where the Repair filter had no effect. These fixes were applied to the following reports: • Parts Usage Analysis - Qty • Parts Usage Analysis - Qty - Global • Parts Usage Analysis - Value • Parts Usage Analysis - Value - Global • Parts Usage Details - Global • Parts Usage Interrogation • Parts Usage Interrogation - Global	33205

Version 8.21

The following is a list of all changes and updates addressed in AMT Version 8.21.

Overview

The major changes between AMT Version 8.20 and 8.21 are as follows:

- To ensure the most secure experience, AMT 8.21 requires the .NET Framework 4.8 to be installed on the AMT Application Server and Windows computers running the AMT Client.
- The license key system used by AMT has changed in AMT 8.21. Existing customers upgrading to AMT 8.21 from an earlier version will need to obtain a new license key from RPMGlobal. Contact Customer Care for assistance.
- The IIS Application Pool used by AMT now runs as a 64-bit process. When installing AMT 8.21, or upgrading an existing version, you must modify the App Pool settings by ensuring the **Enable 32-Bit Applications** option in the **App Pool Advanced Settings** is set to **False**.
- This release requires new post-installation steps to ensure the correct registration of the AMT Server components.
- The AMT Click Once client can be launched using the new Microsoft Edge browser with the Click Once policy enabled. See https://docs.microsoft.com/en-us/deployedge/microsoft-edge-policies#clickonceenabled
- Notification Screens have replaced Messages references.
    - AMT Home Page.
    - Fleet Condition.
- In Long-term Planning, the Messages column has been replaced to reference Notifications.
- In Long-term Planning, View Notifications available to replace Messages.
- Failure Mode Analysis (FMA) Rule Interpretation.
- Depreciable Asset Disposal has been modified to streamline the depreciation calculation.
- AMT Client System Table screen for Budget Type.
- The AMT Budget Header now opens directly from Create New or Copy Budget.
- Publish AMT Budget:
    - Budget Export to EPF based on Budget Type.
    - Budget Extracts supported:
        - Direct Equipment Costs.
        - Overhead Costs.
        - Labour Hours.
    - All budget header fields available as metadata in Integration Management Services (IMS).
    - In IMS, pre-configured Data Set Definitions for:
        - Direct Equipment Costs - 12 months.
        - Direct Equipment Costs - 5 years.
        - Overhead Costs - 12 months.
        - Overhead Costs - 5 years.

- Labour Hours - 12 months.
- Labour Hours - 5 years.

RPMGlobal ITOps team must enable Feature 33 "Enterprise Planning Framework" in the AMT_FEATURE database table to allow this functionality to be available within the AMT Client.

Non-AMT Product process reference:

In **Integration Management Studio** (IMS), the following tasks need to be completed to support any publish budget process:

- User access and appropriate permissions.
  - IMS users may not be AMT Users but personnel (for example, Financial users) who will consume the published AMT data.
- Create Data Location, AMT as a minimum.
- Create Data Source and Destination.
- Pre-configured Data Set Definitions (Export.xml) loaded into IMS.

Minor Enhancements

The following are the change requests and enhancements addressed in this release.

System Requirements

.Net framework : Work Item 32375

AMT 8.21 requires the **.NET Framework 4.8** to be installed on both the AMT Application Server and any Windows computers running the AMT windows client. This requirement was introduced to ensure AMT provides the most secure experience for customers.

The .NET Framework 4.8 runtime installer can be downloaded from here:

https://dotnet.microsoft.com/download/dotnet-framework/thank-you/net48-web-installer

License Keys

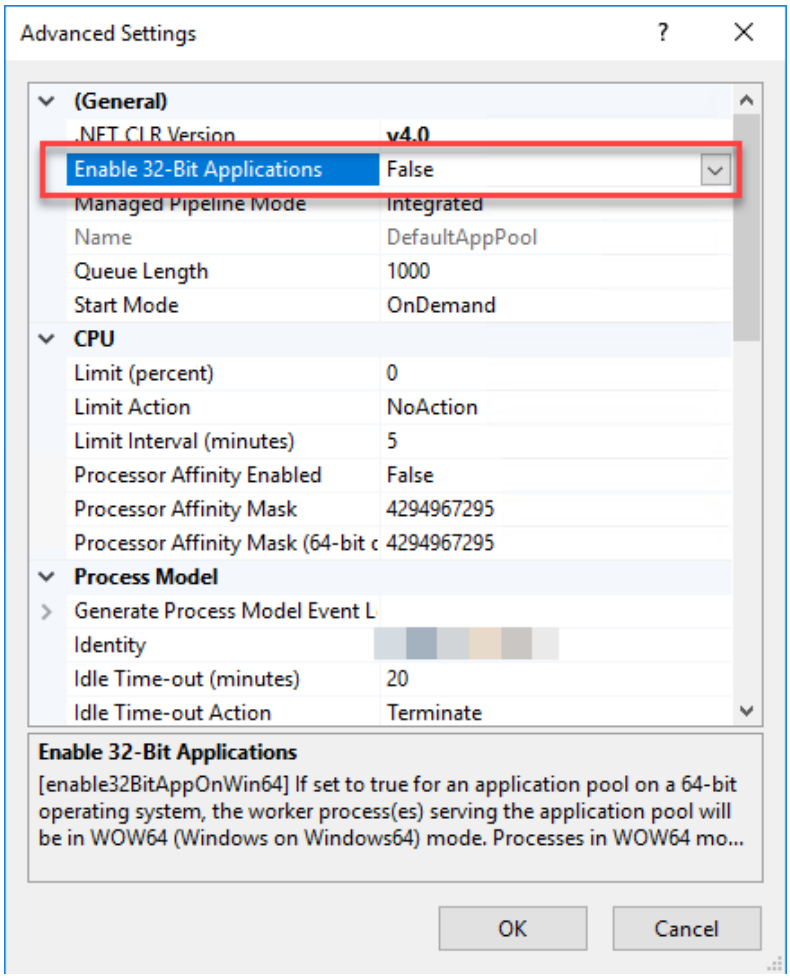

New License Keys : Work Item 21877

The license key system used by AMT has changed in AMT 8.21. Existing customers upgrading to AMT 8.21 from an earlier version will need to obtain new license key from RPMGlobal.

Contact Customer Care for assistance.

Installation

AMT 8.21 requires the IIS Application Pool that hosts the **AMTDataWCF** service to run in pure 64-bit mode. After installing version 8.21, or upgrading an existing installation, go to the App Pool **Advanced Settings** page and ensure the **Enable 32-Bit Applications** setting is **False**.

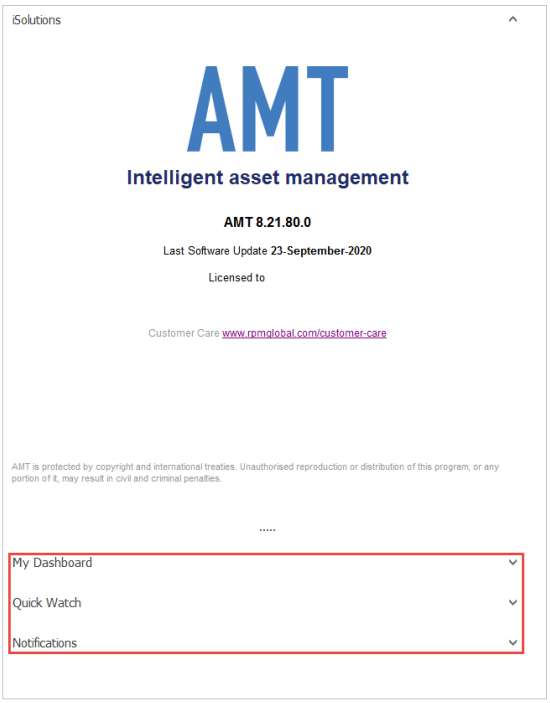

Home Page

AMT Home Page modifications : Work Items 32222, 32768

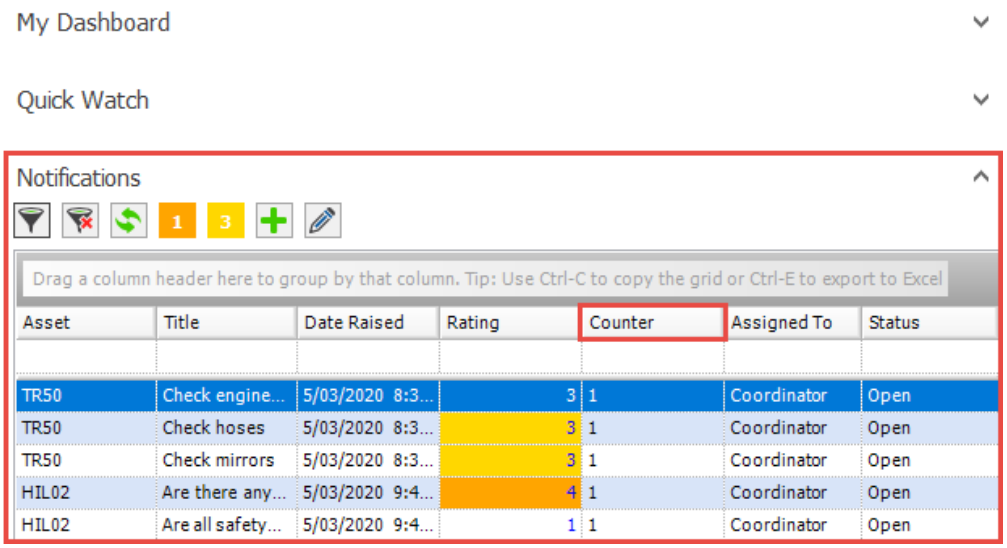

Background

My Messages has been replaced with **Notifications**. My Messages were technically deprecated in AMT 8.14 (2017), however, references remained across various AMT screens and processes and messages could be manually created and maintained. User confusion occurs, however, where processes that created notifications from AMT 8.14 onwards and not messages were not seen. It was thought that Notifications would display in the same screen as My Messages, and when a notification was not visible (notifications is a web screen), users would often create a manual My Message. This would duplicate effort and not achieve the desired process improvements.

User impact

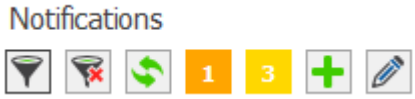

The **Notifications** option can be expanded to show underlying notification detail, with AMT grid filter and grouping capability.

Default fields displayed: Asset, Title, Date Raised, Rating, Counter, Assigned To and Status.

Counter is a new field added to support identification to users there have been multiple updates to the notification.

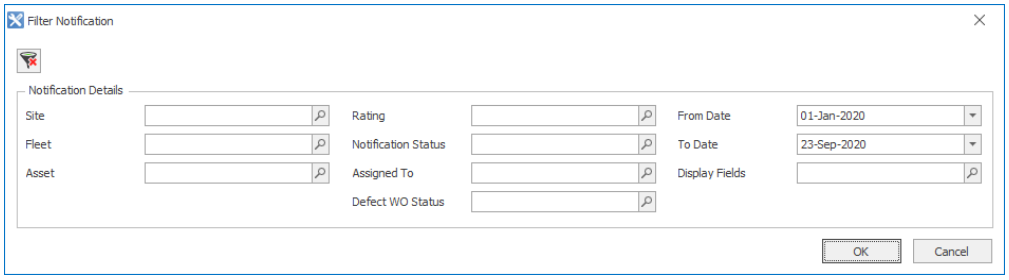

Notification icons

Icon	Description
	Ability to filter notifications.
	Ability to clear filters.
	Refresh the results.
	Number represents the number of notifications with that warning level indicator - level 4, 1 warning.
	Ability to add a new manual notification.
	Ability to edit an existing notification.

Filter explanation

The filter options on the home page notifications operate as follows, and differ in the date area from the filters when accessing the web notifications screen directly.

How filter notification works with the AMT Client window

1. Filters can be set in line with the standard AMT paradigm with the exception of **From Date** and **To Date**. It is a software design decision to ensure any saved date filters does not preclude a user from seeing new notifications when the screen is opened.

The **AMT_VARIABLE MessageAutoRefreshDelay** setting controls the refresh rate for Notifications. The control is an INTEGER representing milliseconds, and it determines the frequency with which the message board polls for new messages.

60000 ms = 60 seconds = 1 minute.

2. **Date** filters can be changed from the default values and will apply for the time the screen is active. If you close the screen or navigate away from the screen, the date filters will return to the default.
3. Default Date filters will display:

   Date From = (midnight/00:00:00) Today's date - 1

   Date To = (23:59:59) Today's date

   If you run this screen at 2.15 in the afternoon on September 1, 2020, the results will display all notifications that have a date greater than 31-Aug-2020 00:00:00 and 01-Sep-2020 14:15:00.
4. The **Clear Filter** icon will reset last used filters (excluding dates which are not saved).
5. Notifications display in a grid with the software design standard columns (Asset, Title, Date Raised, Rating, Counter, Assigned To, Status). Additional columns can be added to this grid based on one or more of the Display Fields selected.

   Display field options are:

   - Defect Workorder Status
   - Serial Number
   - Site
   - Customer
   - InspectionType
   - Operational Impact
   - Source Workorder
   - External ID
   - Source
   - Occupational Health and Safety
   - Notification Number

   Source and Notification Number may be useful columns for users to include.

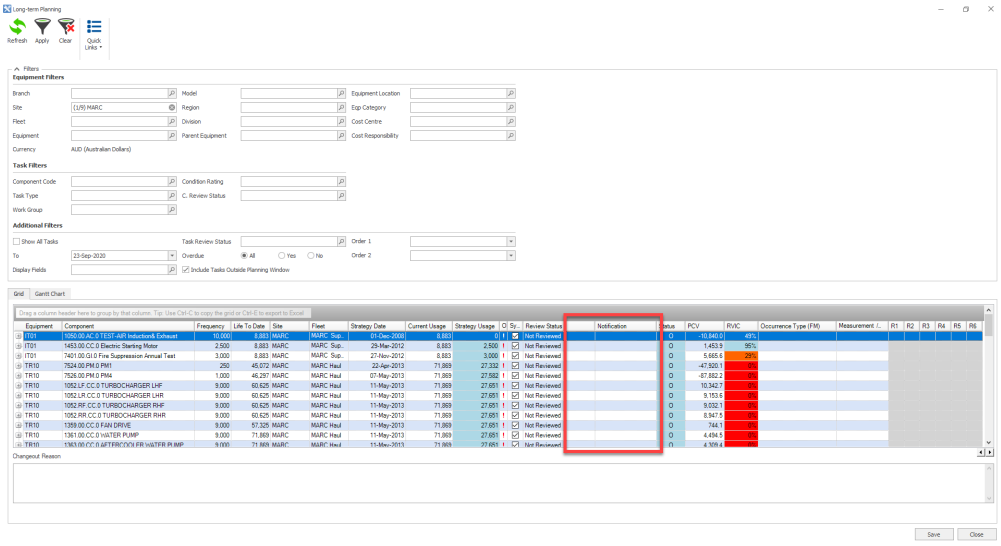

A new manual addition or edit to an existing notification will direct you to the notification's web screen.

Long-term Planning

Work Items : 32222, 32768

Messages references have been changed to reflect Notifications in Long-term Planning.

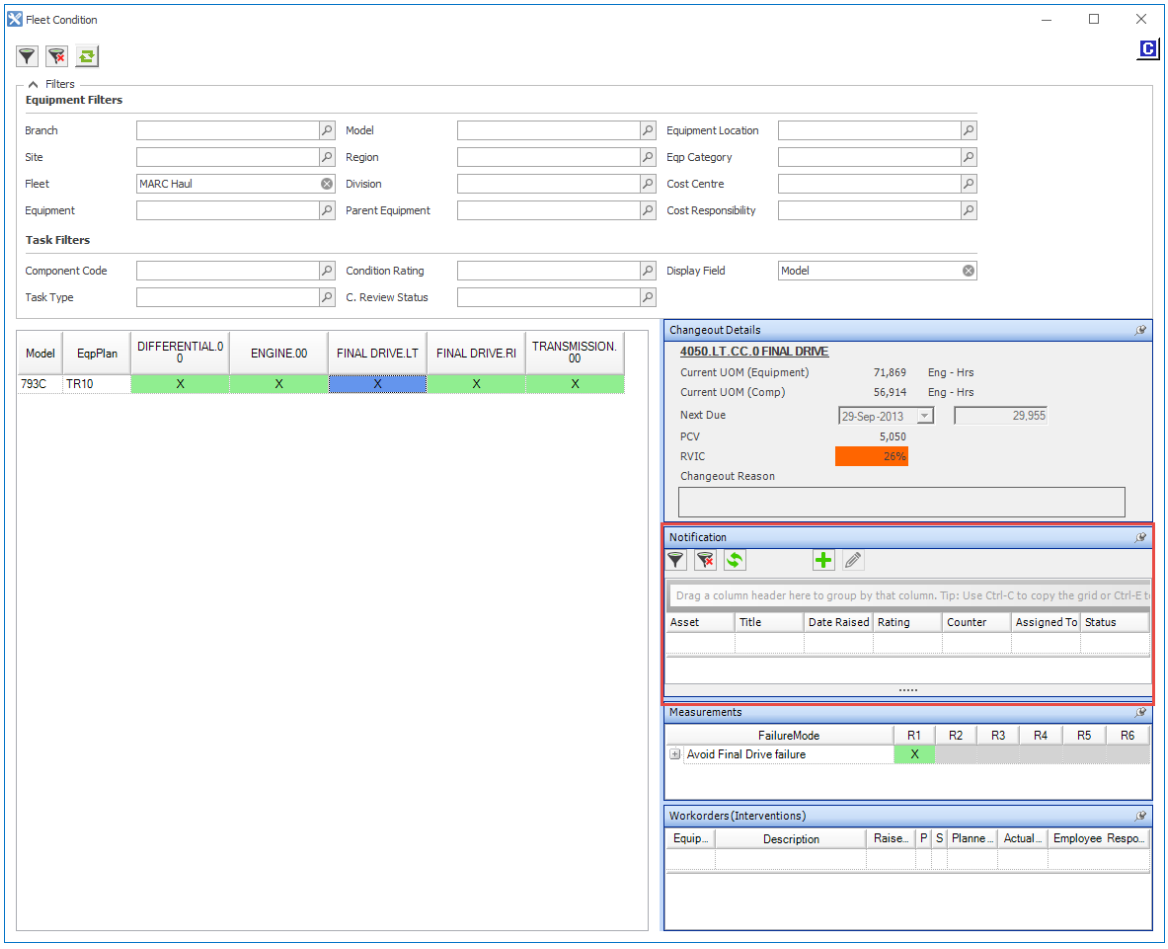

From the grid, right mouse click gives you the ability to **View Notifications**. You are given the same user experience screens for review as mentioned above as the replacement for Messages. You add a new notification or edit an existing notification in the **Notifications** web screen.

Fleet Condition

Work Items : 32222, 32768

The **Fleet Condition** screen shows **Notifications** versus **Messages**. When a notification is edited, AMT will launch and open the Notification in the AMT Notifications web screen.

Refer to the information provided above in AMT Home Page on how notification filtering works.

In the Fleet Condition panel, only Failure Mode Analysis notifications display.

Failure Mode Analysis (FMA) Interpretation

Work Item : 32221

Failure mode rule interpretation occurs at the strategy task, and AMT reviews all rules. Prior to AMT 8.21, if a notification exception was triggered on one rule within the strategy task, AMT would generate and send a

notification for all rules whether an exception was triggered on that rule or not. In AMT 8.21, this interpretation has been modified to only generate a notification when the individual exception rule or rules are triggered.

Additionally, an interpretation rule that references several measurements will consider the currently received measurement in conjunction with the interpretation rule's other last known measurements to determine if a notification is triggered.

If AMT Failure Mode Analysis is not currently configured, and additional detail is required on this module that has been available in AMT for some years, please contact your RPMGlobal Sales Representative or Consultant for further detail and training requirements.

Depreciable Asset Manager - Asset Disposal

Work Item : 31363

The **Depreciable Asset Disposal** process for recognising and creating depreciation on asset disposal has been updated to provide a more automated user experience based on information known by AMT.

Previous versions would require any final month's depreciation to be manually calculated and entered on the disposal screen.

In AMT 8.21, you still execute the disposal process from the **Depreciable Asset Manager** grid or **Quick Links** menu.

Worked Example:

Depreciation calculated until the end of August 2020:

Depreciable Asset Register Report

RPMGLOBAL

The engine has cumulative hours of 6,500 Eng Hrs until the end of August and depreciation processes have been run monthly to account for depreciation. Cumulative Eng Hrs on 10 September 2020 equals 6,600.

The engine suffered a catastrophic failure on 11 September during the night shift. From a business perspective, the engine needs to be disposed on this date and a new engine will capitalised for this asset.

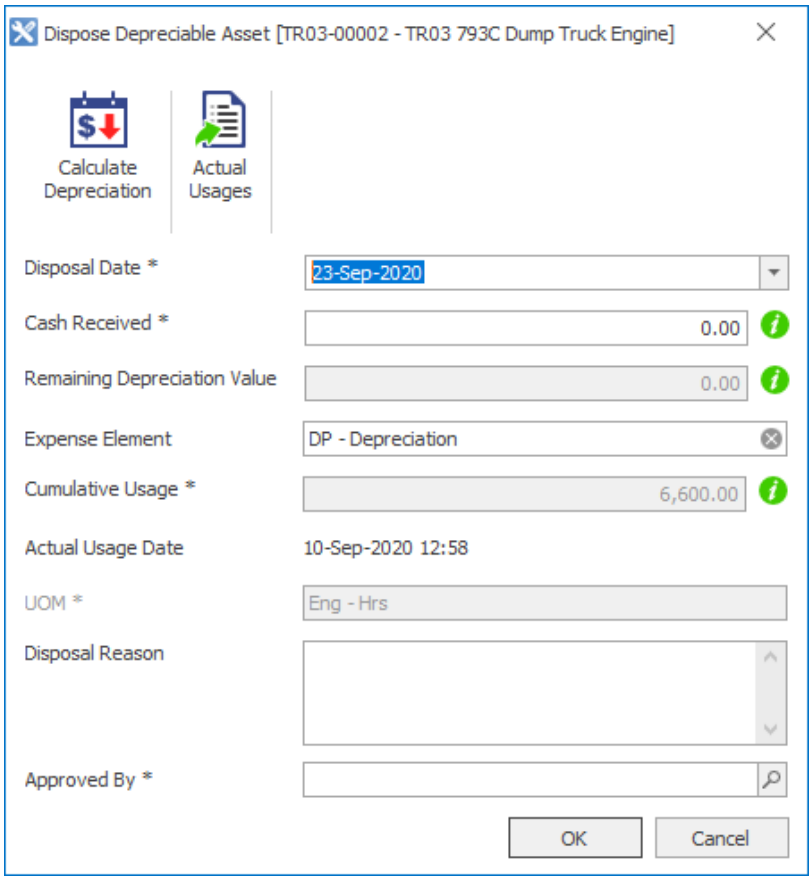

The new engine capitalisation using the Add Additional Asset process is not discussed here as this process has not changed from prior releases.

The cumulative engine hours for the asset when the engine failed were 6610. These are not entered into AMT when the disposal process was undertaken.

Known information about the engine at time of failure:

- Engine capitalised 04 May 2020 for 1,000,000.00
- Accumulated Depreciation to 31 August 2020 = 325,000
- Expected Engine Life = 20,000 Eng Hrs
- Cumulative Engine Hours to 31 August 2020 = 6,500
- Cumulative Engine Hours @ Failure (10 September 2020 @ 22:00) = 6,610
- Cumulative Engine Hours recorded in AMT (11 September 2020 @ 02:00) = 6,600

The **Disposable Asset** screen for Engine when launched on 23 September 2020 shows:

Disposal Date - defaults to current date; can be changed to disposal date.

Cash Received - any cash expected or received from the sale or scrap of this asset.

Remaining Depreciation Value - will calculate based on usage information recorded in AMT.

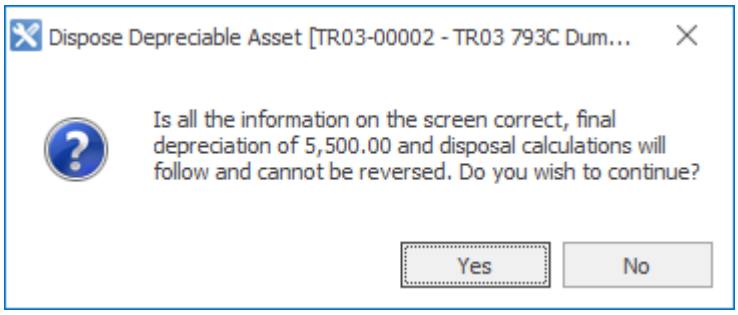

- If default cumulative usage is correct, that is, usage was 6,600 when the engine failed, then Calculate Depreciation icon can be run without any modification to the usage.
- If the default cumulative usage is not correct, then use the Actual Usages icon to launch Actual Usages screen and update the actual usage details with the most accurate information.

Expense Element - defaults to the expense element on the Depreciation Strategy Task.

The **Calculate Depreciation** process will calculate and present the depreciation for the month up until the disposal for this asset. You should perform a visual assessment of this information to confirm its accuracy.

When the usage information is correct, depreciation calculated and all mandatory information has been added, click **OK** to finalize the disposal calculation process.

You will be presented with a warning 'confirmation' message to acknowledge as the disposal calculations cannot be reversed.

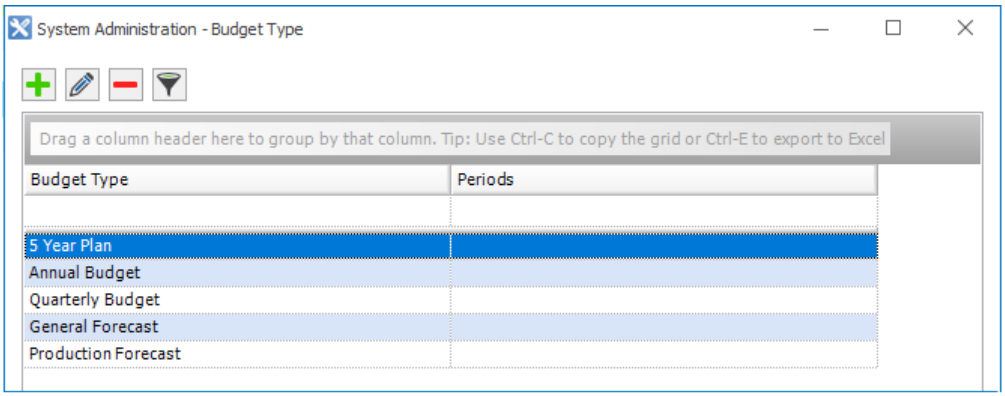

Budget Type System Table

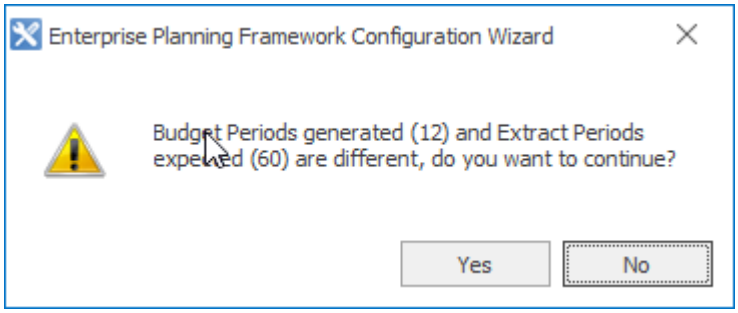

Work Items : 31167, 31474, 31476

AMT did not have an AMT Client System Table for Budget Type. This was rectified in AMT 8.21. The system table is located under **System Administration** > **System Tables** > **Financial**.

The system table gives the user (preferably a system administrator, or capable user), an AMT Client UI method to add new, update or delete budget types. Previously this required an SQL database updates.

A user can associate a number of periods with a budget which is used as part of the Publish process. The number of periods associated with a budget will be compared with the number of periods of the associated Data Set Definition (DSD) during the EPF Configuration Wizard process. If the DSD Periods (what the export expects) do not equal the Budget Type periods (what AMT is generating), the user will be given a warning message.

The user is not prohibited from completing the set up. The warning message is advising that the configuration is mismatched and therefore the results that are published may not be what is expected.

Enterprise Planning Framework Manager

Work Items : 30927, 32372

Prior to performing this configuration step, a budget must already be created for each Budget Type to allow the Data Set Definition (DSD) association.

AMT Enterprise Planning Framework Manager (EPF) configures the AMT Budget Export to EPF options where AMT extract and metadata is mapped to IMS Data Set Definition(s) created. The EPF Manager is located under **System Administration** > **AMT Utilities**.

This function should be the administered by a key user who understands the data expectations of consuming solutions – XERAS or BPC are examples.

RPMGlobal has provided six ‘out of the box’ example Data Set Definitions (DSDs) which need minor configuration management in AMT to support the export of any of AMT’s annual (12-month) or 5-year budget types.

Any additional budget duration exports require both Data Set Definitions (in IMS) and AMT Enterprise Planning Framework Manager configuration to be completed by customers.

A 12-month Direct Equipment Cost DSD is illustrated in the following example.

Using the Enterprise Planning Framework Configuration Wizard:

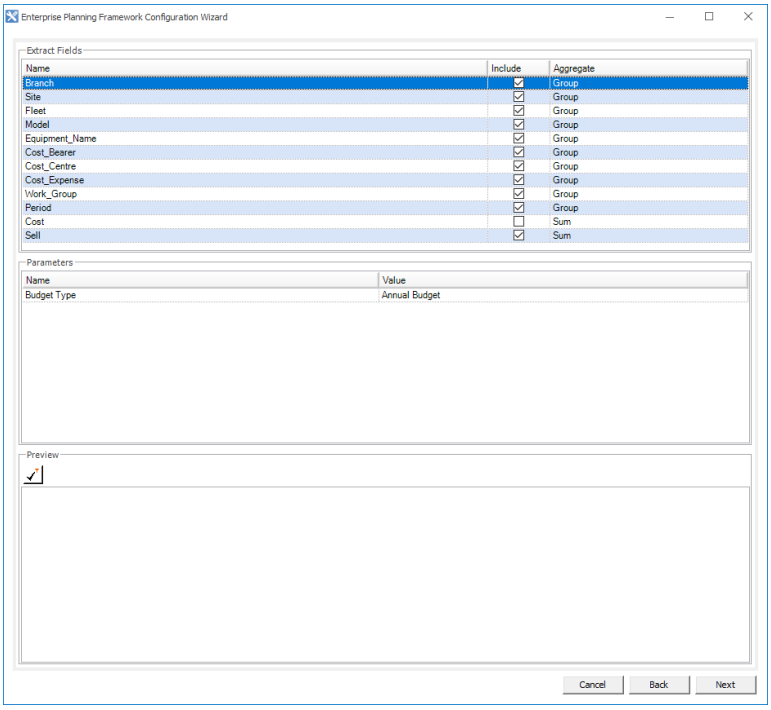

1. Create an exchange **Type** for 'Annual Budget' (as an example), with selected **Exchange Type** = Direct Equipment Cost.
2. Select a **Data Set Definition**, a **Source** and **Destination**.

   These need to be created in IMS prior to this step.

The drop-down lists will provide a list of all DSD, Sources and Destinations that exist within IMS. You should select a DSD that matches the Exchange type and duration being created. By way of example, if creating an Annual Budget Exchange, select a 12-month or 1-year DSD. It is not necessarily logical, or practical, to create an Annual Budget Exchange and associate a 5-year DSD; it will not produce the result expected.

Click **Next**.

3. Select the data fields to be exported from the budget and select the Annual Budget (in this example), parameter.

Click **Next**.

4. The Pivot process can be handled automatically by default, but requires the **Period Extract Field** to be selected in the **Extract** step. If you want to use Pivot differently, at least three **Extracted Fields** must be selected. Within those three columns, at least two must be **Group** and one must be **Sum**. Pivot can be modified by selecting the **Pivot** check box. If there is no change to the default, do not select **Pivot**.

Click **Next**.

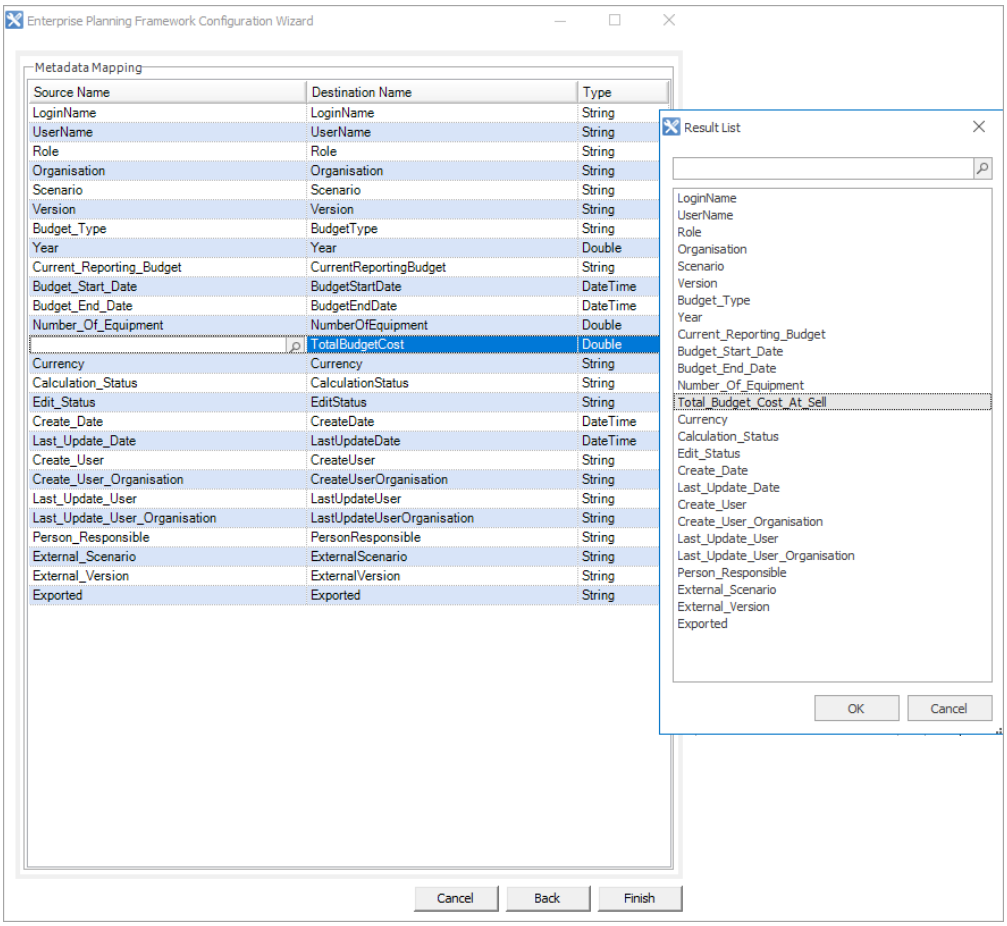

5. The screen displays the column mapping between AMT fields and the Destination (DSD) columns. This is pre-populated for the pre-configured DSDs provided by RPMGlobal. For any additional configurations,

this step will need to be performed in more detail where the Source Columns in AMT will need to be mapped to the DSD destination columns. The source columns are those selected in Export Fields.

Source Name	Destination Name	Type
Branch	Branch	String
Site	Site	String
Fleet	Fleet	String
Model	Model	String
Equipment_Name	EquipmentName	String
Cost_Bearer	CostBearer	String
Cost_Centre	CostCentre	String
Cost_Expense	CostExpense	String

Sell	Y1M07	Double
Sell	Y1M08	Double
Sell	Y1M09	Double
Sell	Y1M10	Double
Sell	Y1M11	Double
Sell	Y1M12	Double

Click **Next**.

6. This step maps the AMT metadata (budget header fields) to the appropriate Destination (DSD) columns. This is again pre-populated (except for the Total_Budget_Cost_At_Sell) for the pre-configured DSDs provided by RPMGlobal. Any additional new configurations will need this step to be completed with items selected from the drop-down options available.

Click **Next**.

7. Click **Finish** to complete the configuration.

The above process needs to be completed for each of the six pre-configured DSDs provided if publishing Direct Equipment Costs, Overhead Costs and Labour Hours. If only Direct Equipment Costs were to be published, then the above would be completed twice.

Reminder: Any additional budget duration exports will need to be configured in detail.

Budget & Forecast Manager

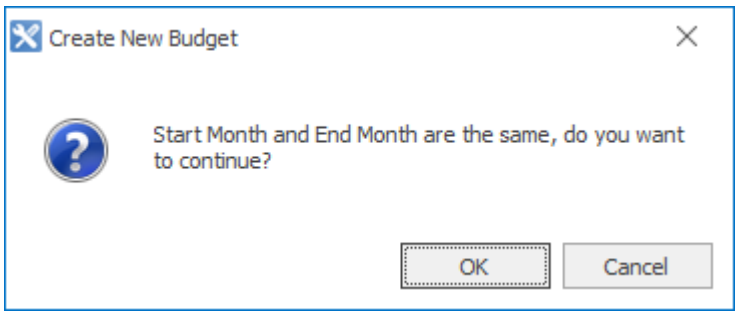

Create New Budget : Work Items 30927, 32372

Budget Header Start and End Date

When creating a new budget, the **Start Date** and **End Date** will default to the current period if the budget type has no associated period definition in the system table. If the system table has associated periods, AMT will calculate the End Date based on the Start Date and number of periods.

Previously, this would have been historical periods unrelated to the current budget process.

When the End Date defaults to the current period, this needs to be changed unless you plan to create only a 1-month budget. You will be given a warning message identifying only a single period will be created. You can choose to continue, or Cancel.

Clicking **Cancel** allows you to adjust the end period to suit their requirements.

The reason to default the End Date to the current period is that the budget duration can be variable and, to default to 12 months as an example, could also be inappropriate.

Budget Header Manager window

When creating a new budget, you are presented with the **Budget Header Manager** window directly on **Create New Budget**. This allows equipment to be added, and operates the same as previous versions of AMT.

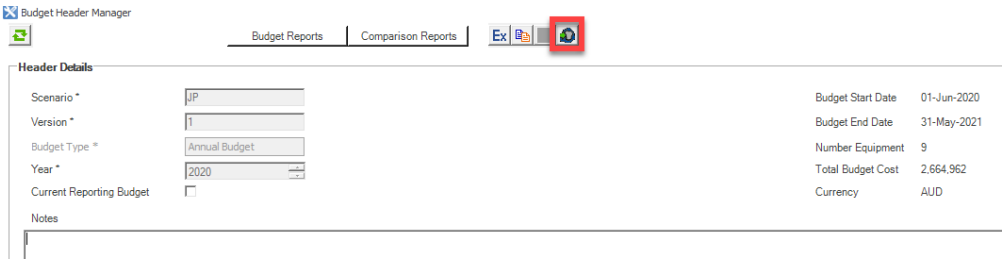

The **one-click open budget header process** has been introduced in this release. In prior releases, you would need to enter the Create Budget details, refresh Budget & Forecast Manager, locate the budget header created in the list and open this budget header.

Similarly, when you copy a budget, you are taken to the directly to the Budget Header Manager versus having to refresh, find and open the item.

Publish Budget process

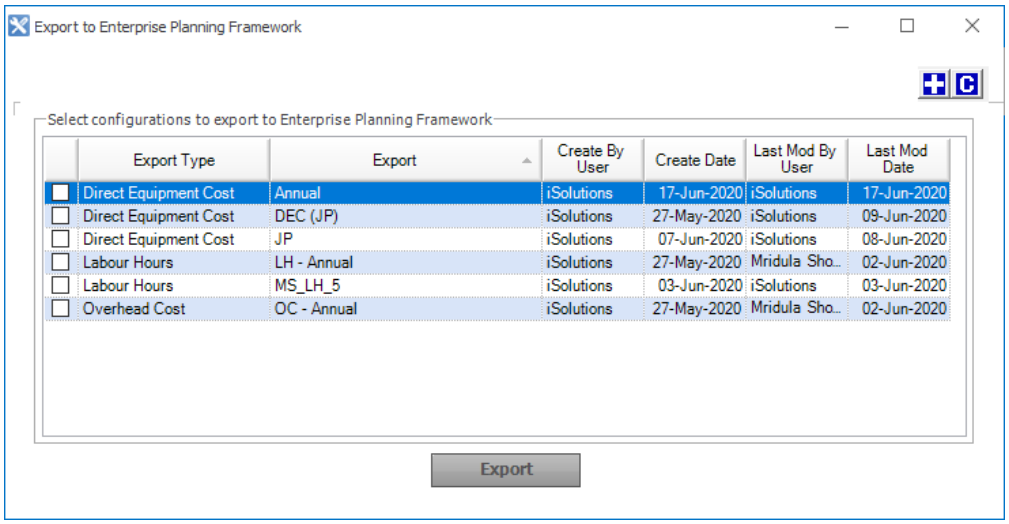

Once a budget has been created, Direct Equipment Costs, Labour Hours and Overhead Costs, if they exist, can be published.

The button highlighted in the screenshot below is **Export Budget to Enterprise Planning Framework**.

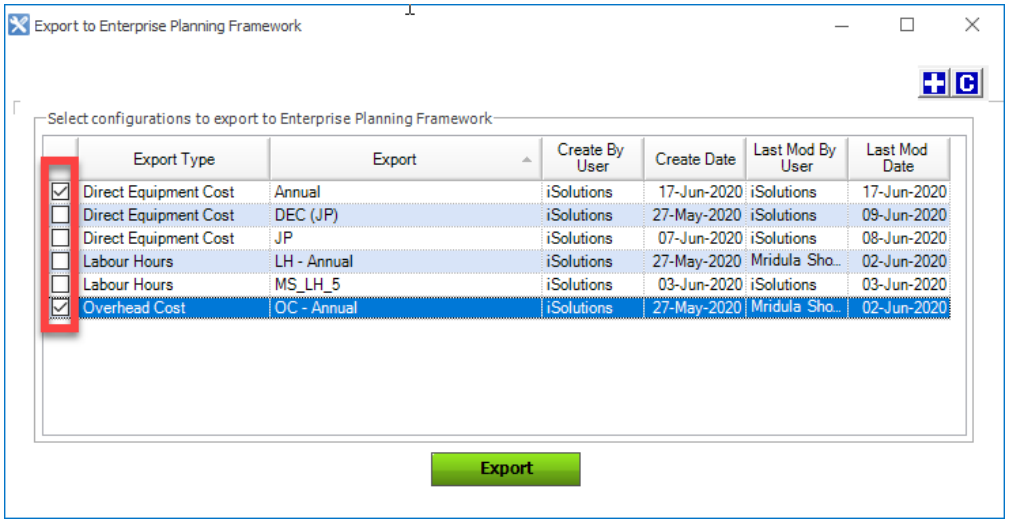

When you click this button, AMT will find all the matching Export Configurations that match the Budget Type nominated in the budget header.

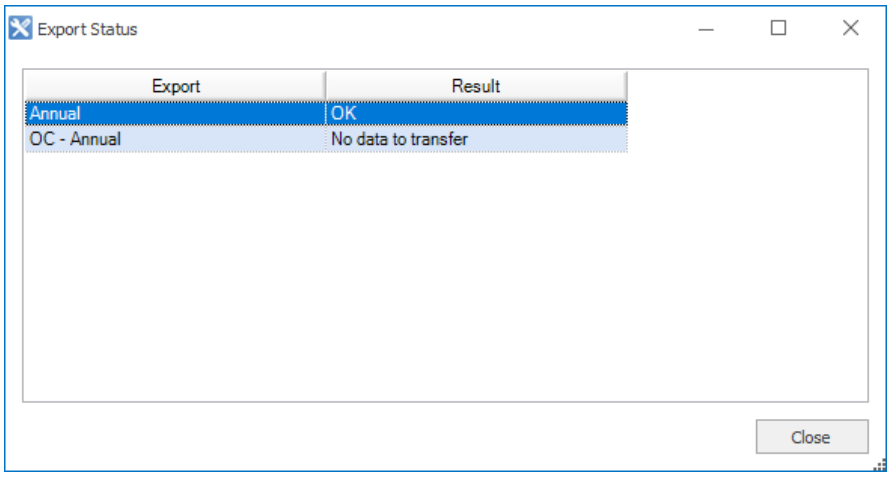

In the above example, **Budget Type** = Annual Budget and there are six export type configurations related to this Budget Type. The screenshot below shows there are three Direct Equipment Cost exports, two Labour Hour exports and one Overhead Cost export.

The check boxes allow you to select one or more exports.

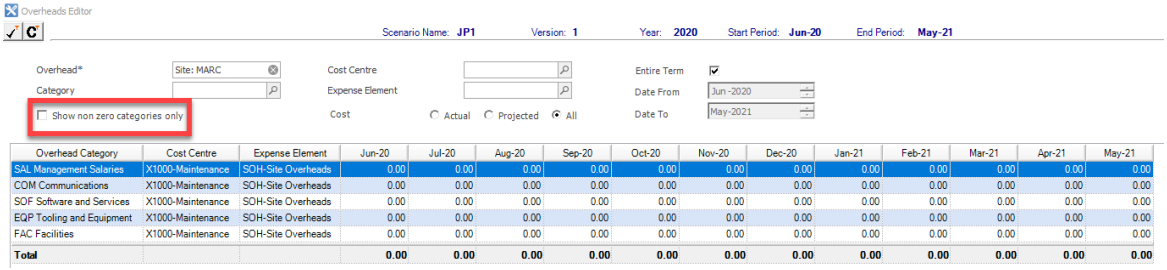

Click the **Export** button to publish the data to EPF. AMT will feedback to you immediately whether the exports are a Success or Failure, with appropriate messaging if the export did not occur.

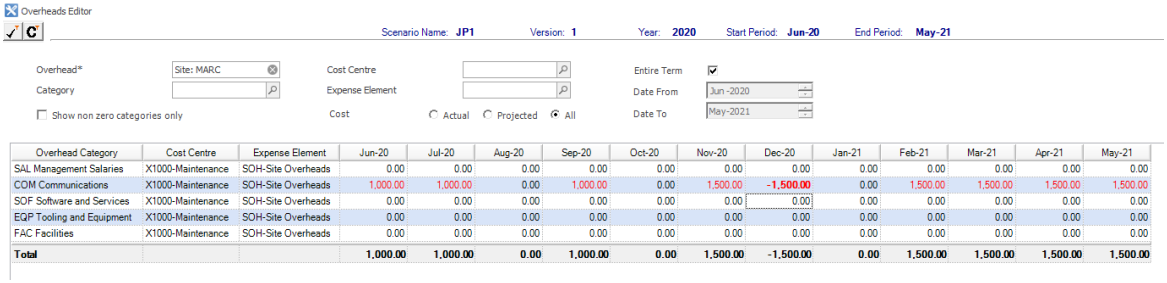

A note on overheads:

If overheads are entered in AMT Budget and Forecast Manager, they are available for export. In the **Overheads Editor**, a check-box determines the display (or not) of zero values.

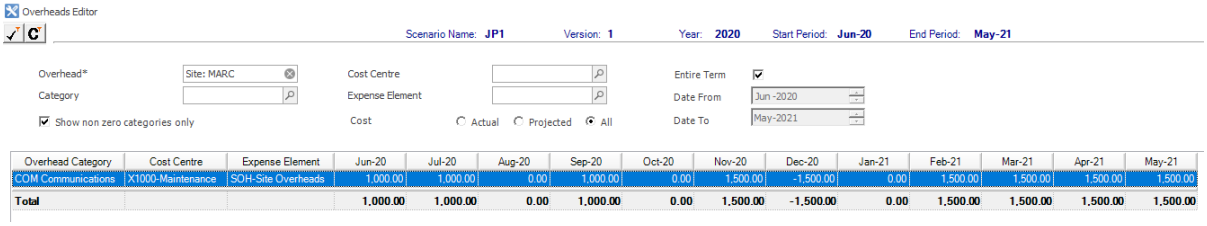

Assume the following overhead budget with only **Communications Overheads** completed for this example.

Zero categories and negative numbers displayed:

Zero categories not displayed:

An issue has been fixed in this release where negative numbers were not displayed when **Show non zero categories only** is selected.

When **Overhead Costs for export** are configured in the Enterprise Planning Framework Configuration Wizard, in addition to selecting the Budget Type parameter you may chose to **Export Zero Cost** or not. The default option is to not export non-zero costs but this can be changed for the pre-configured DSDs provided.

These AMT release notes are not intended to train or include full configuration notes on the IMS process. These are available from the consultants who help you with your EPF installation.

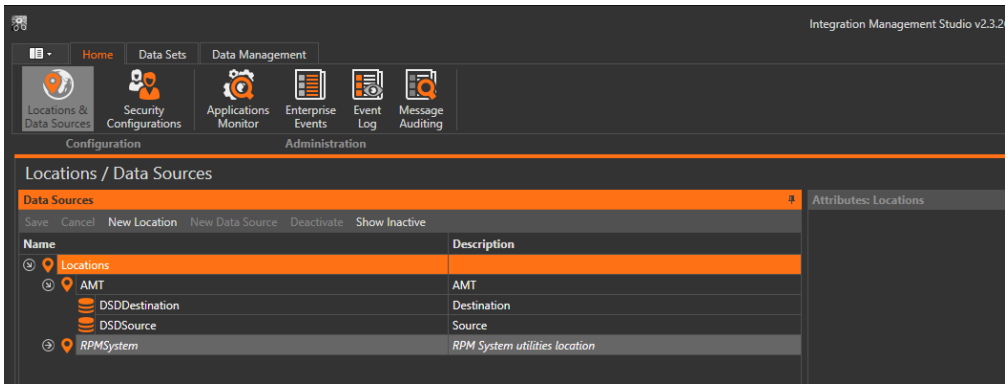

The following IMS screens illustrate a check of information. They allow an end user to undertake a quick review for situations where information may not display and can assist with a ‘where to look’ when troubleshooting issues in the first instance.

FAQs

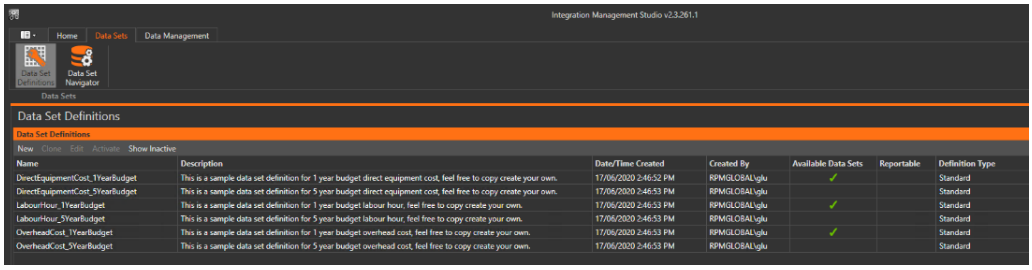

1. The RPM preconfigured DSDs have been installed in IMS but do not display?
    - Check that an AMT Location exists.
    - If an AMT Location exists, check that an AMTSource and AMTDestination exists.
2. The AMT Location, AMTSource and AMTDestination exist, but in Data Navigator, no results display in the Data Sets window.
    - Check that a Data Set definition has been selected in the top-left window.
    - Check that the Location, Source and Destination are selected in the lower-left window.
3. All the left-side windows have items selected and the information exported does not display in the right side window.
    - Check the DSD for the corresponding data exported has been selected in the top left window.

Minimum Integration Management Studio (IMS) Configuration

1. User access and appropriate permissions need to be configured.
    - IMS users may not be AMT users but personnel, for example Financial users, who will consume the published AMT data.
2. On the **Home** tab, click the **Locations and Data Sources** icon.
    - Data Location created (for example, AMT as a minimum).
    - AMT Source and Destination created.

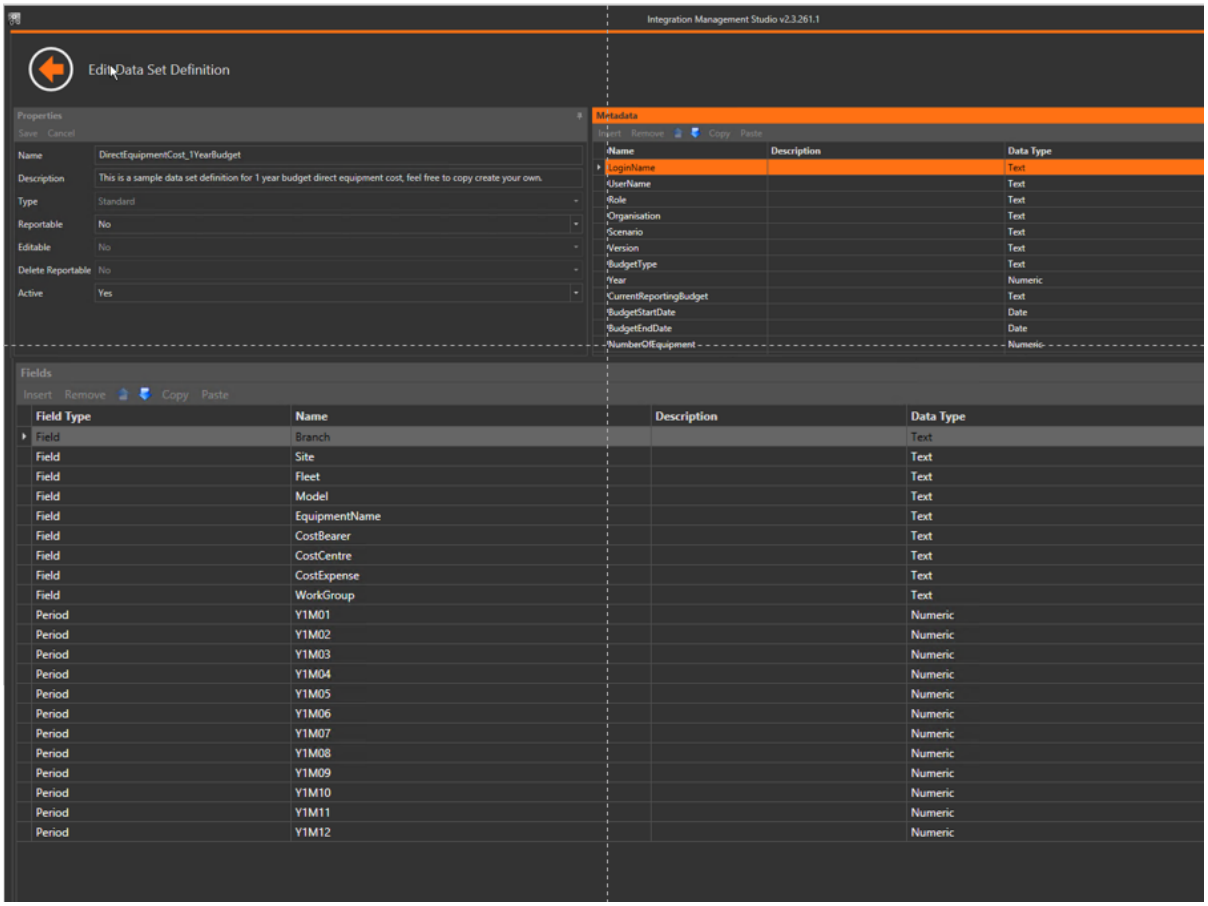

3. On the **Data Sets** tab, click the **Data Set Definitions** icon.
    - Pre-configured Data Set Definitions (Export.xml) are loaded into IMS.

4. From the list of Data Set Definitions, highlight an item. You then have the ability to review (edit), clone, create (add new) and so on.

The following screenshot illustrate the 12-month Direct Equipment Costs pre-configured DSD.

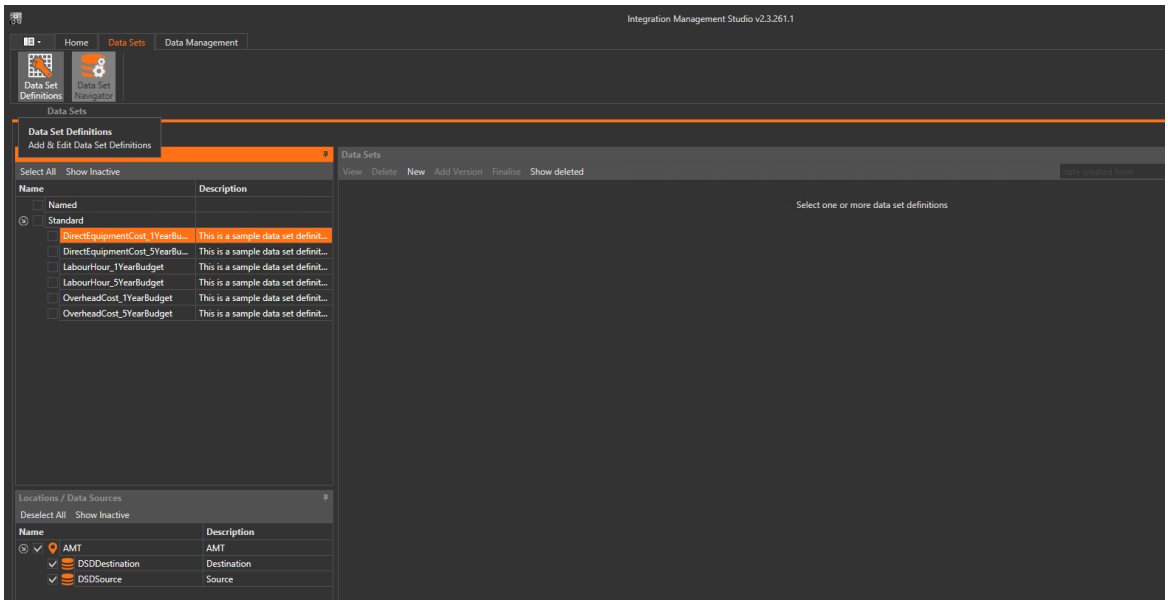

A longer duration DSD, for example 5-year, will have more fields mapped for the 60 periods.

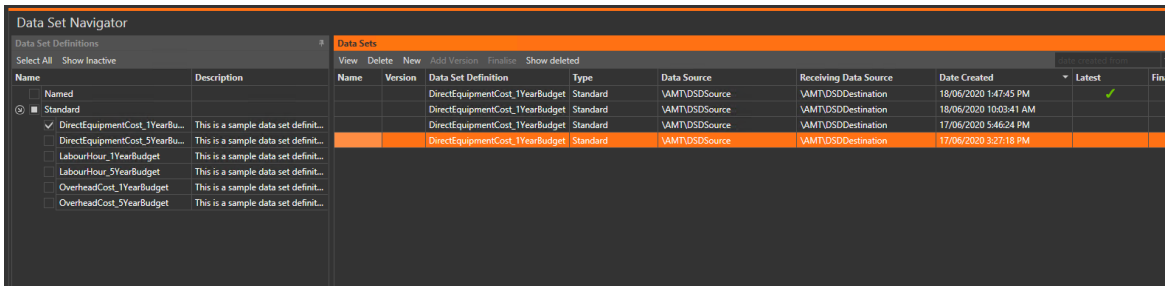

If additional DSDs are required for different durations, or to export less budget header references or less budget data, refer to your training guides within EPF on how to create DSDs, or ask for assistance from your consultant or key IMS user.

To review exported AMT Budget data, on the **Data Sets** tab, click the **Data Set Navigator** icon.

The left-side windows display the Data Set Definitions, Locations, Sources and Destinations.

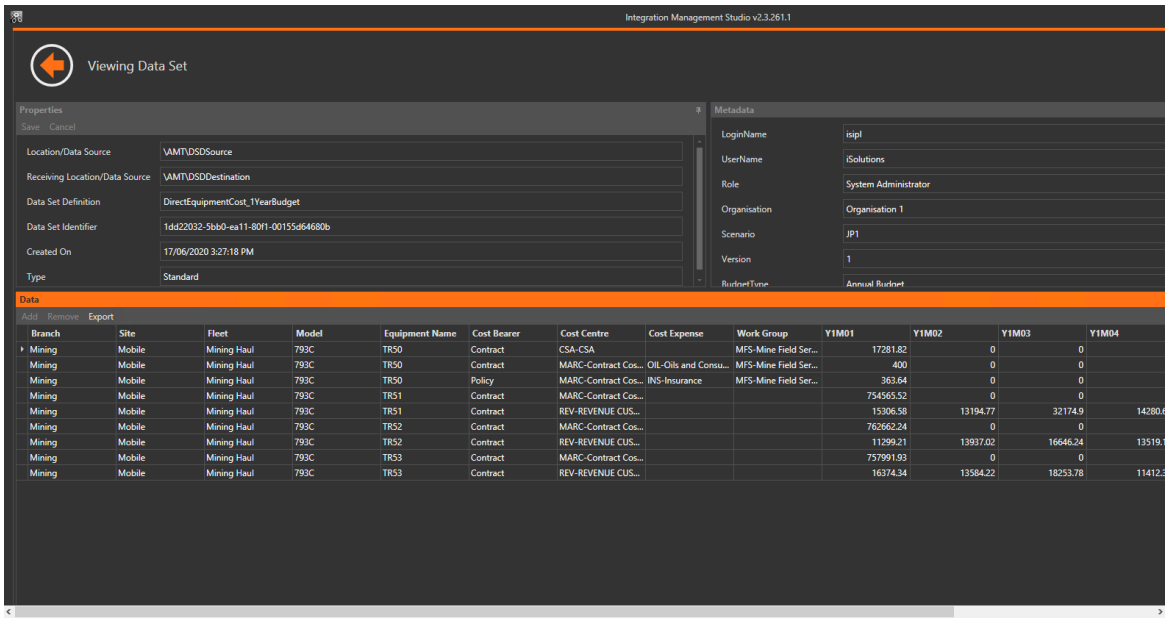

A DSD, Location, Source and Destination must be selected to display a list of the available exported data. By default, information is listed in date order with the latest export at the top.

When an item is selected in the window, options in the toolbar change to **View**, **Delete** and so on.

Select **View** to show the data exported from AMT.

IC Reporting

Work Item : 31677

Site View, in IC System Tables Data Model, called **[SystemTableDataModel],[Site]**, exposes all Site Table details for reporting.

The View exposes:

- Site Id
- Branch Id
- Site
- Shift Start Time
- Modular Mining Site Name
- Time Offset Hours
- Site Code
- Default Spares Delivery Location
- Site Street Address
- Site Suburb
- Site State Code
- Employee Level Resourcing
- Weekly Plan Start Date
- Currency
- Resource Scheduling Key

Issues Resolved

The following is a list of all issues resolved.

Functional Area	Fixes	Work Item
Budgets	It is no longer possible to enter duplicate downtime values. The existence of duplicate values was causing an error when adding the equipment to a budget.	31040
	Fixed several errors in the **EPF Budget Export** feature, including spelling errors, incorrect tool tips and an issue where the total budget cost value shown in the EPF Integration Management Studio did not match the total budget cost shown in AMT.	31221
	Currency validation is now being applied when a budget is created.	31477
	In the **EPF Budget Export** feature, budgets with only small numbers of equipment but large volumes of overhead costs no longer fail due to excessive processing times.	31478
	Fixed several issues in the **EPF Budget Export** feature that could cause an error when previewing a budget export when no budget exists for the budget type. The **+** button on the **Export to Enterprise Planning Framework** dialog was removed (this was an invalid option). Specifying a non-existent exchange type no longer results in an error when creating a new **EPF Budget Export** definition.	31552
	In the **Budget Forecast Manger**, defining a filter that includes models, then selecting **Replace costs with actuals/current projection** no longer results in an error.	31612
	In the **EPF Budget Export** feature, not supplying a pivot configuration on the pivot wizard no longer results in an exception.	31940
	In the **EPF Budget Export** feature, creating a new Budget Type without specifying a period no longer results in an exception.	32180

Functional Area	Fixes	Work Item
Depreciation	In **Component Based Depreciation**, the Depreciable Asset Manager no longer indicates accrued depreciation when assets have not worked.	32242
	In the **Depreciation Strategy Task Editor**, locale settings for the thousands and decimal separator symbols are now being recognised.	32244
	It is now possible to dispose of an asset with a capital value of $0.00.	32334
	Fixed several issues in the **Disposable Depreciable Asset** screen, including: 1. An exception that could occur when filtering for all assets. 2. Changed the label **Final Lifetime Usage** to **Cumulative Usage**. 3. Using the up and down arrow keys to change the Dispose data value now reflects the change to the data internally.	32419
	Fixed an issue where the **depreciation impairment** process did not allow negative values to be supplied. With the ability to accept a negative impairment value, users can now resolve incorrectly processed transactions and process impairment reversals.	32437
	Fixed an issue where the written down value was incorrect because it did not consider EDC 210 (Impairment) transactions.	32438
	Fixed an issue in the **Depreciable Asset Register** report, where the report did not consider the impact of Impairment and Revaluation transactions (EDC 210 and EDC 213).	32439
	In the Depreciable Asset Manager, the Disposal value no longer displays using more than two decimal places.	32506
	Impairment values are now being considered when disposing of assets.	32588
	The **transfer process** no longer results in split transactions. This was occurring because the transfer process used EDC codes 224, 225, 226 and 227. In this version, the transfer process uses EDC codes 208, 209, 220 and 221.	32589

Functional Area	Fixes	Work Item
Depreciation	An error no longer occurs when opening a **Live Depreciation Strategy Task**. This error was occurring when legacy depreciation strategy tasks were present.	32622
	Fixed an issue where, when disposing an asset, it was not possible to allocate any residual depreciation to an expense element. In this release it is now possible to choose the expense element any residual depreciation should be assigned to.	32691
DLCC	Automatically created accrual settlements that had been manually edited by a user no longer causes the DLCC engine to fail.	31129
	A failure in the **Process Live SSAS System Task** no longer causes the DLCC engine to fail.	31714
Equipment	Fixed an issue where, under some conditions, an error could occur using the **Create Real Equipment from Modelling** feature.	31752
	The **Equipment Administration** filter no longer fails if very large numbers of equipment are selected	31818
Fleet	Fixed an issue in **Long Term Planning** equipment filters where opening the **Display Fields** filter could result in a timeout and ultimately an error. The root cause was a logic error in the interpretation of certain fleet attributes.	31635
	Fixed an issue where entering a **Standard Job Parts Pricing Adjustment Factor** on the **Edit Fleet** screen with a value >0 and <1 would result in the factor being incorrectly rounded. In this version, values >0 and <1 are treated as decimal values.	31635
	Moving an equipment between fleets no longer results in an unexpected warning that the transfer will result in excessive strategy task occurrences. The problem only occurred with equipment configured to use component-based depreciation.	32122
Forecasting	In the **Forecast Cost Adjuster**, unassigned tasks now have their actual costs adjusted.	31193

Functional Area	Fixes	Work Item
Integration	Fixed an issue where clicking the **Work Order** > **Create ERP W O** button when an error condition was detected did not display a message to the user. In this release, details of any errors are displayed.	32271
	In the **Next Occurrence Export** feature, clicking the **Next Part Number Required** selector in the results grid no longer pops up a filter selector populated with Sales Status items.	32374
	Fixed an issue in the **Proposed Equipment Billing Interface** where the following fields documented as returning times using a 24-hour format were returning data in a 12-hour format: • Start Reading Date • End Reading Date	32616
Mobile	Strategy task descriptions are no longer truncated in the AMT **Mobile Quoter** function.	28849
	The **Record Measurements** feature is now able to accept decimal formatted measurements.	29002
Microsoft Excel Integration	Pasting work order numbers copied from an Excel sheet into the Workorder Number field in the Additional Filters section of the Workorder Settlement Manager screen no longer includes the hard return character added by Excel. The pasted value is now visible.	32056
Microsoft Project Integration	Fixed an issue where the **Workplan** > **Export for MS Project** function where work order operations were not exported correctly, resulting in incorrectly structured MS Project Files. This issue was only seen under certain circumstances and was dependent on the name and number of operations.	30167

Functional Area	Fixes	Work Item
Planning	Fixed an issue where the **Updating Planning System Task** could stall. In this release, the system task checks for and rejects the duplicate data that caused the issue.	31546
	Fixed an issue where, under certain circumstances, applying a filter in the **Long-Term Planning** screen could result in an error. This issue was caused by certain invalid characters present in the AMT Logging database.	31598
	The **Bulk Printing** feature now supports the same document being linked to different work order operations within the same work order.	31149
	SSRS Reports can now be printed from AMT Web even if SSRS has not been installed to the default location.	31156
Quick Watch	Fixed an issue where the **Quick Watch** could not be opened under certain screen resolutions or form sizes.	30627
Reports	The **PLESN Report** no longer causes a timeout if too many branches are included.	39544
	In the **PLESN Report**, selecting all branches and all task modes no longer results in an error.	31453
	Fixed a performance issue with the **Forecast Worksheet (Dealer Adjusted)** Report that could cause a timeout error.	31419
Strategy Tasks	In **Long Term Planning**, strategy tasks no longer display without a status if the task contains an operation that does not have a description.	31535
	Fixed an issue where it was not possible to create an **alternate projection** in the source projection due to a unique key violation. In this version, the accrual value of the source projection is included when creating the copy, ensuring uniqueness.	31606
Suppression	Fixed an issue where the **Suppression Schedule** could become misaligned, resulting in previous strategy usages showing greater values than current usages.	31794

Functional Area	Fixes	Work Item
Usages	Fixed an issue where, under some circumstances, it was not possible to add a new UOM to a **Usage Profile**. The root cause was that AMT did not keep in sync the UOMs in usage profiles with actual equipment usage.	31151
	Fixed an issue where adding **duplicate usage readings** could ultimately result in seemingly valid usages being marked as invalid in the usage maintenance view.	31685
Work Orders	Fixed an issue with the **Workorder Settlement Manager**, where applying certain filter combinations would result in the message ***Please select equipment that have the same site currency and try again***. This message would display even when equipment did have the same currency as the selected site.	30509
	Fixed an issue where providing a start and end date range in the **Daily Planning** > **Workorders** tab could result in less than the expected number of results. This was caused by locale-specific date and time settings.	31171
	Adding a **Work Order Settlement** no longer fails if no default currency has been defined.	31458
	The **Event Merging Wizard** no longer changes the actual and planned start dates of work orders.	31816
	On the work orders **Specify Operation Codes** grid, data in the grid now matches the column headings.	32713
	In the **Work Order** > **Measurements** tab, the measurement grid sorting no longer resets each time the user changed the grid grouping options.	31577

Version 8.20

The following is a list of all changes and updates addressed in AMT Version 8.20.

Overview

The major changes between AMT Version 8.19 U1 and 8.20 are as follows.

- Ability to filter for strategy tasks when using Add Work Order process.
- Searchable Results grids have been added to Daily Planning.
- In Daily Planning, Maintenance Period has been added as a result column on Work Orders and Backlog.
- In Daily Planning, Maintenance Period has been added as a filter on Planning, Shift Log and Work Orders.
- In Daily Planning, Work Order Status column has been added and colour coded within Scheduling.
- RVIC Report has been enhanced to include a cost bearer search.
- Additional Maintenance Period parameters have been added to all IC cubes that reference the Shutdown dimension.
- The Shutdown dimension has been added to the AMT IC Work Order cube.
- Interface Date format has been updated to include both date and time in the Interface Log Report.

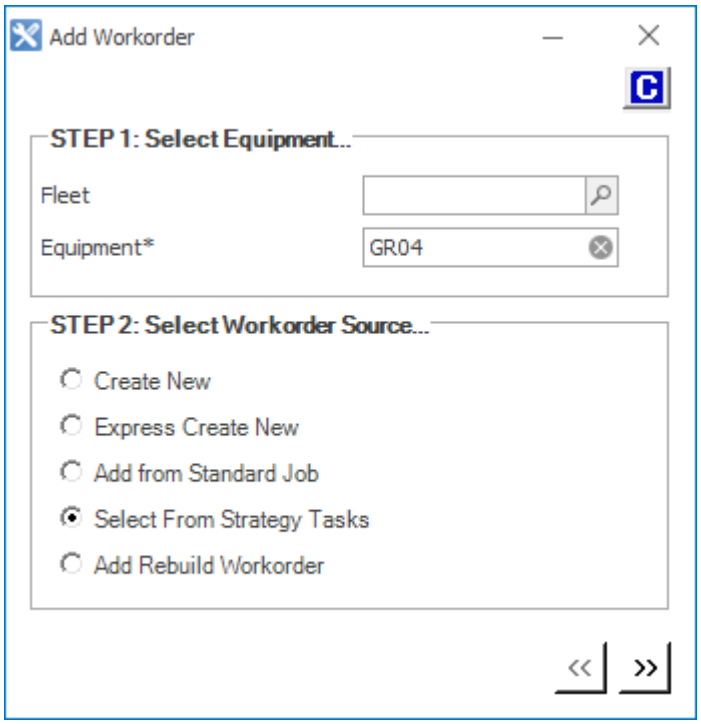

Enhancements

The following are the change requests and enhancements addressed in this release.

Work Orders

Filter for strategy tasks: Work Item 30374

When creating a work order from a strategy task, you can now filter for strategy tasks versus having to scroll through a long list of strategy tasks.

Filters provided are:

- Component Code
- Modifier Code
- Task Type
- Description

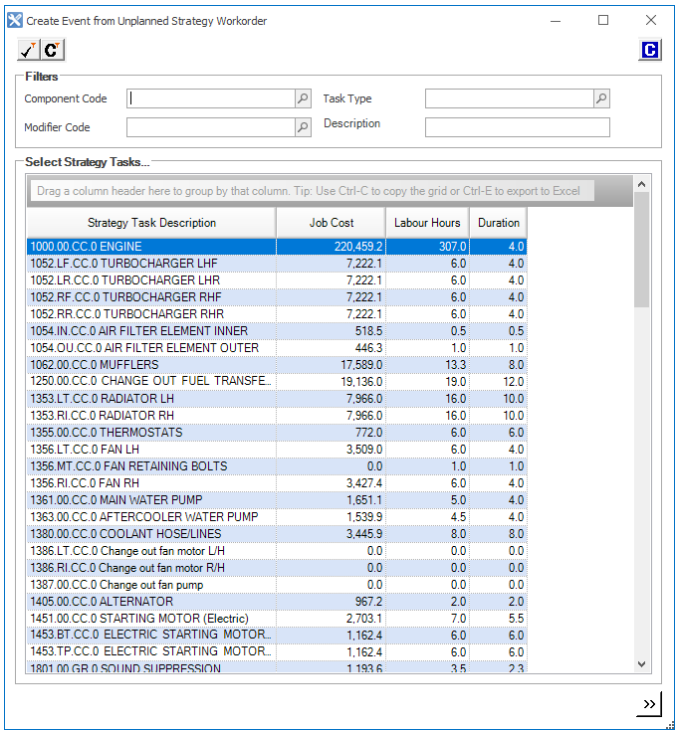

The **Component Code**, **Modifier Code** and **Task Type** are multi-select filters. The **Description** will search the Strategy Task Description for any letters that match the search criteria.

The Description is the description that is entered on the Strategy Task. This is not a mandatory field, and is left blank in some customer's AMT environments.

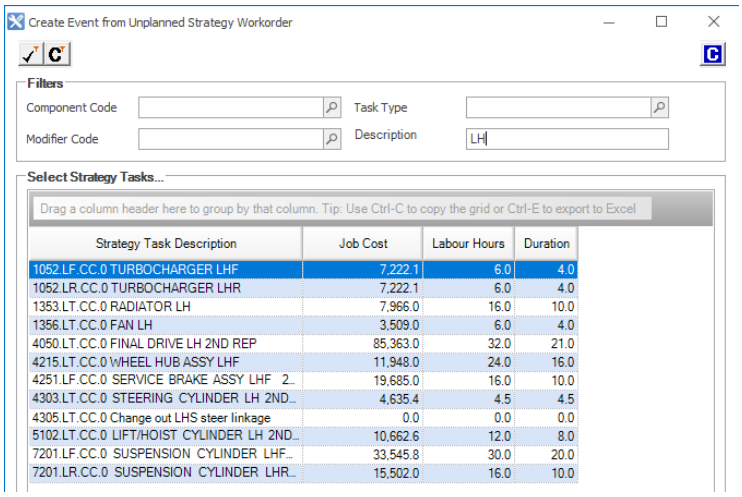

Example

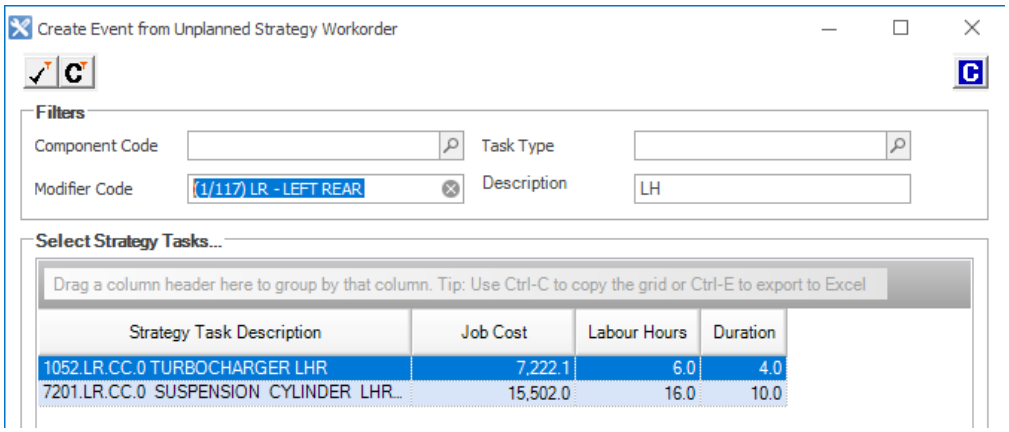

Return all strategy tasks using the filter icon with no filters used.

Filter strategy tasks where **Description** contains LH.

Filters can be used in combination, for example, filter for **Modifier Code** LR and **Description** contains LH.

The **Add Work Order** > **Select from Strategy Task** is available in the following areas:

- Daily Planning > Planning > Edit > Add Work Order
- Daily Planning > Planning > Filter on Work Orders > Right mouse click in Results Grid > Add Work Order
- Daily Planning > Backlog > Edit > Add Work Order
- Daily Planning > Events > Edit > Add Event
- Daily Planning > Events > Open Event > Work Orders > Add Work Order
- Daily Planning > Equipment Down > Search > Select and Edit Event > Add Work Order
- Daily Planning > Shift Log > Search > Select and Edit Event > Add Work Order

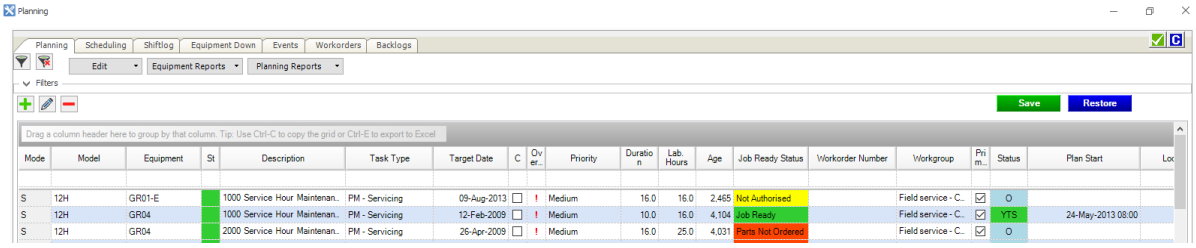

Planning

Searchable grid : Work Item 30376

In addition to the grouping results grid information, Planning screens for work orders and events have additional searchable grid functionality.

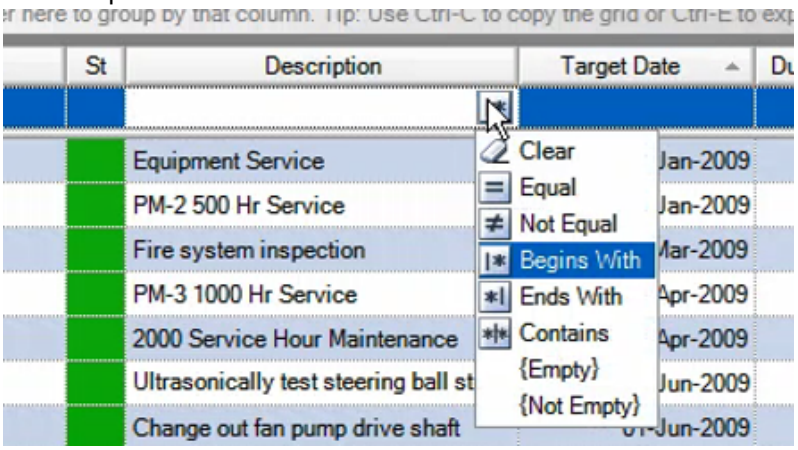

Searchable grids are available in:

- Daily Planning > Planning > Planning
- Daily Planning > Planning > Scheduling > Work Orders
- Daily Planning > Planning > Shift Log
- Daily Planning > Planning > Events
- Daily Planning > Planning > Work Orders

A searchable grid allows a user to, depending on the column information, search based on:

- Equal
- Not Equal
- Begins With
- Ends With
- Contains
- Greater Than (for dates and numbers)
- Greater Than or Equal To (for dates and numbers)
- Less Than (for dates and numbers)
- Less Than or Equal To (for dates and numbers)
- (Empty)
- (Not Empty)
- Clear – option to remove the search criteria

Maintenance Point filter : Work Item 30499

In Planning, the **Maintenance Point** has been added as a filter in additional places as follows:

- Daily Planning > Planning > Planning
- Daily Planning > Planning > Work Orders
- Daily Planning > Planning > Shift Log

The Maintenance Point filter was already available on:

- Daily Planning > Planning > Scheduling
- Daily Planning > Planning > Equipment Down

Maintenance Point results : Work Item 30383

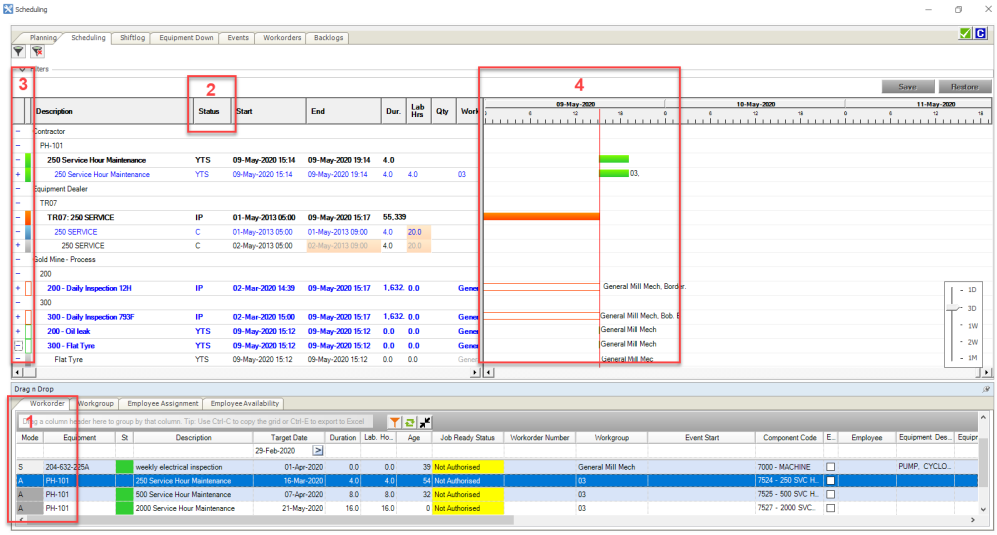

The **Maintenance Point** has been added as a results column in:

- Daily Planning > Planning > Work Orders
- Daily Planning > Planning > Backlogs

It displays in the **Results** grid with the column header of **Shutdown**; this is consistent with other display grids.

Scheduling tab new look : Work Item 30526

In **Daily Planning** > **Planning** > **Scheduling** there have been some aesthetic changes to assist with understanding and visualisation of the work order statuses and the equipment planning mode.

1. The first column in the Work Order results grid has a new heading, **Mode**. This column indicates the Equipment Planning Mode – Standard Planning (S) and Advanced Planning (A). Individual rows within the results grid will now display either an A or an S as well as the previously Dark Grey and Light Grey theme. The use of the A and S assists with the new grid filtering mentioned previously.
2. A new status column has been added to the Scheduling Grid which will display the status of the Event and Work Order.
3. Colour visualisation within the Scheduling Grid has been enhanced for work order status from previous AMT versions. The full colour explanation is included below:

	Colour	AMT Entity	Meaning
	Black	Shutdown	Shutdown
	Solid Green Bold Black Font	Event	Yet To Start Event
	Solid Orange Bold Black Font	Event	In Progress Event
	Solid Orange Blue Font	Advanced Planning Work Order	In Progress Work Order

	Colour	AMT Entity	Meaning
	Solid Green Blue Font	Advanced Planning Work Order	Yet To Start Work Order
	Solid Teal Blue Font	Advanced Planning Work Order	Completed Work Order
	Gold Blue Font	Advanced Planning Work Order	Abandoned Work Order
	Moccasin Blue Font	Advanced Planning Work Order	Deferred Work Order
	Orange Outline Bold Blue Font	Standard Planning Work Order	In Progress Work Order
	Green Outline Bold Blue Font	Standard Planning Work Order	Yet To Start Work Order

4. Colour visualisation of the bars in the Gantt chart is enhanced and aligns with those in the Scheduling grid.
5. No changes have occurred to Operation and Labour Activity displays.

Scheduling

Work Order results grid : Work Item 30382

The Work Order results grid, by default, displays the ability to group and search the grid. The grouping ability on the grid can be hidden by using the **Collapse** icon.

This will give some additional screen real estate if grouping is not required.

The limited space available on this screen creates some challenges for all the information needed. You will see that, at times, this icon set will move within the header area.

The scheduling process is due for re-engineering with the AMT Web UI.

Reporting

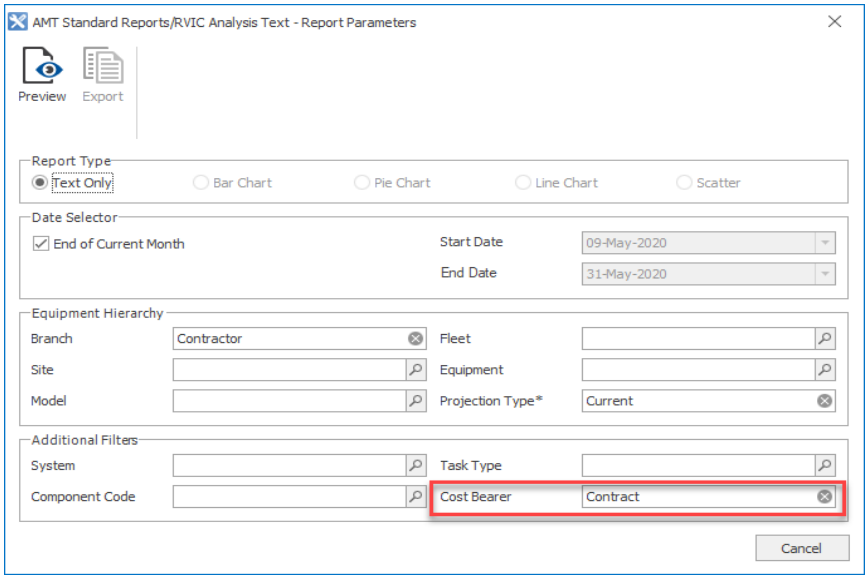

RVIC reports : Work Item 26720

In previous versions of AMT, the **RVIC Analysis** and **RVIC Chart** reports would generate its RVIC calculation based on the default Cost Bearer. There was no ability to select a different cost bearer from the default, nor select one or more cost bearers.

Both the **RVIC Analysis** and **RVIC Chart** Report Parameters have been enhanced to include the Cost Bearer. The field supports the ability to multi-select one or more, or all cost bearers.

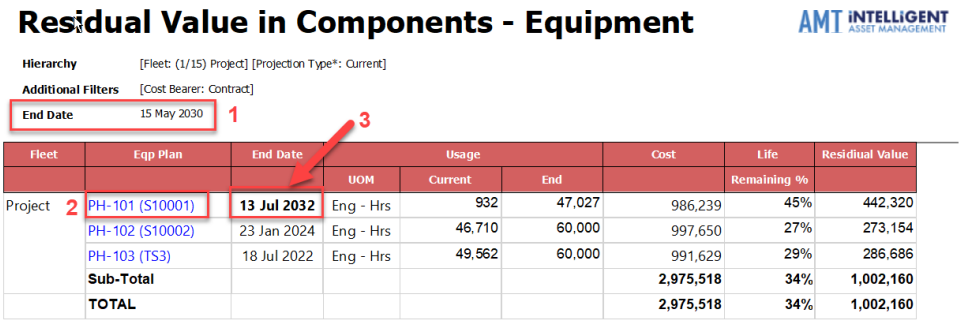

When launched, the report will place the default cost bearer into the Report Parameter field. This will allow the report to perform its calculation as in previous versions.

If you decide to modify the cost bearer, this selection will be remembered as per standard AMT functionality.

Menu option **RVIC Analysis** produces the **Residual Value in Components – Equipment** report. It is now written in SSRS (SQL Server Reporting Service).

The Residual Value in Component – Equipment report displays first; summarised by **Fleet** and **Equipment**.

Residual Value in Components - Equipment

AMT INTELLIGENT ASSET MANAGEMENT

3

1. End Date found in the Report Header displays the End Date input as a Report Parameter. Previously this was not displayed, but may have been displayed in the End Date column for an Equipment if the Equipment Projected End Date was after the report parameter end date.
2. The Residual Analysis Component - Detail report is available with the blue hyperlink.
3. End Date column in the report now displays the Equipment's Projected End Date per the equipment record. If the Equipment's End Date is greater than the End Date for the report, the font will be bold.

When in the **RVIC Analysis Component - Detail** report (screenshot below):

1. New Cost Bearer column displays with information dependent on the report parameters. If no cost bearer selection is made, the report will display the equipment's Component RVIC details for the default cost bearer.
2. You can drill back to the summary report where you may choose to select another equipment to investigate in more detail.

1054.OU.CC.0 AIR FILTER ELEMENT	Contract	Eng - Hrs	932	47,027	250	280	46,806	30	12%	33
1062.00.CC.0 MUFFLER	Contract	Eng - Hrs	932	47,027	19,000	3,979	37,806	9780	51%	2,048

The **RVIC Chart** report parameters are expanded in line with the **Detail Analysis** reports. The **RVIC Chart** report has not been upgraded to SSRS in this version.

These changes apply across all the **RVIC** reporting within **Real Equipment**, **Centrelines** and **Modelling Equipment**.

IC Cubes

Shutdown Dimension : Work Item 30540

The **Shutdown Dimension** for Reporting has been expanded to include all the attributes associated with the Shutdown table. Previously four attributes only were available.

Shutdown ID	Existing
Name	Existing

Description	Existing
Completed	Existing
Site	New
Plan Start Date	New
Plan End Date	New
Actual Start Date	New
Actual End Date	New
SMP Category ID	New

All cubes that reference the Shutdown Dimension have been updated.

- **Budgeting Analytics Cube**.
- **Live Cost Cube**.
- **Occurrence Cube**.
- **Shutdown Quote Cube**.
- **Stoppages and Downtime Cube**.

The Shutdown Dimension has been added to the **Work Order Details Cube**.

Database information and tables are inter-related and the source table information for the shutdown reported in the cube is identified below. It should be noted that the shutdown dimension may not, therefore, always be populated depending on the data relationships.

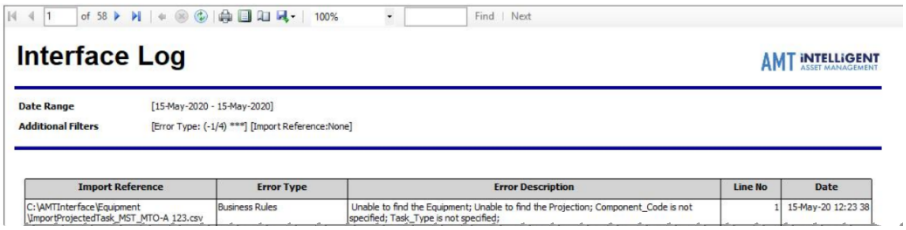

- Budgeting Analytics Cube - from **BUDGET_HEADER** table
- Budget vs Actual Cube - from **BUDGET_HEADER** table
- Live Cost Cube - Future Cost from **tblRepProjCosts** table / Actual cost from **tblWorkorders** table
- Occurrence Cube - Future from **tblRepProjCosts** / Actual from **tblWorkOrders**
- Shutdown Quote Cube - from **SD_QUOTE_JOB**
- Stoppages and Downtime Cube - from **EVENT**
- Workorder Details Cube - from **EVENT/TASK**

Integration Log

Long format date : Work Item 30643

To assist with integration troubleshooting, AMT now includes a Long Format Date in the Interface Log report. This will be particularly useful when there are multiple pages of logs and multiple integrations have been triggered.

Summary Interface Log illustrated below identifies Line Number, Date and Time:

Interface Log

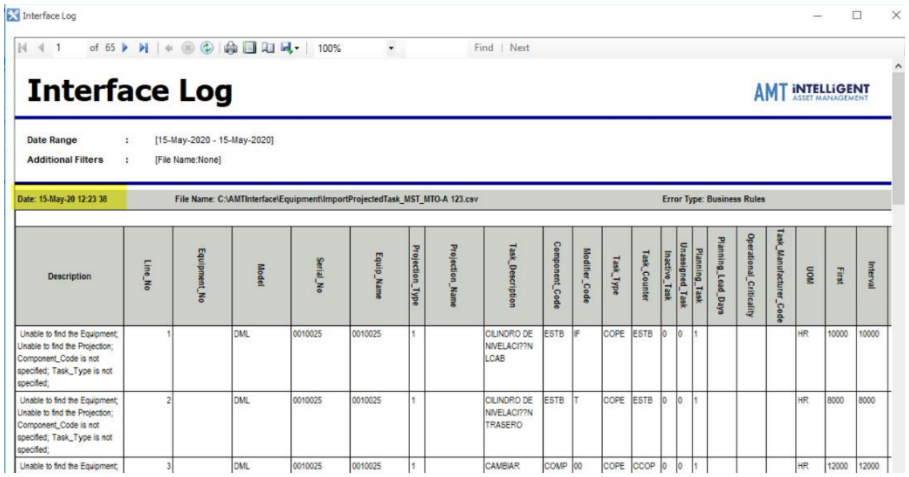

AMT INTELLIGENT ASSET MANAGEMENT

Date Range [15-May-2020 - 15-May-2020]

Daily Operations

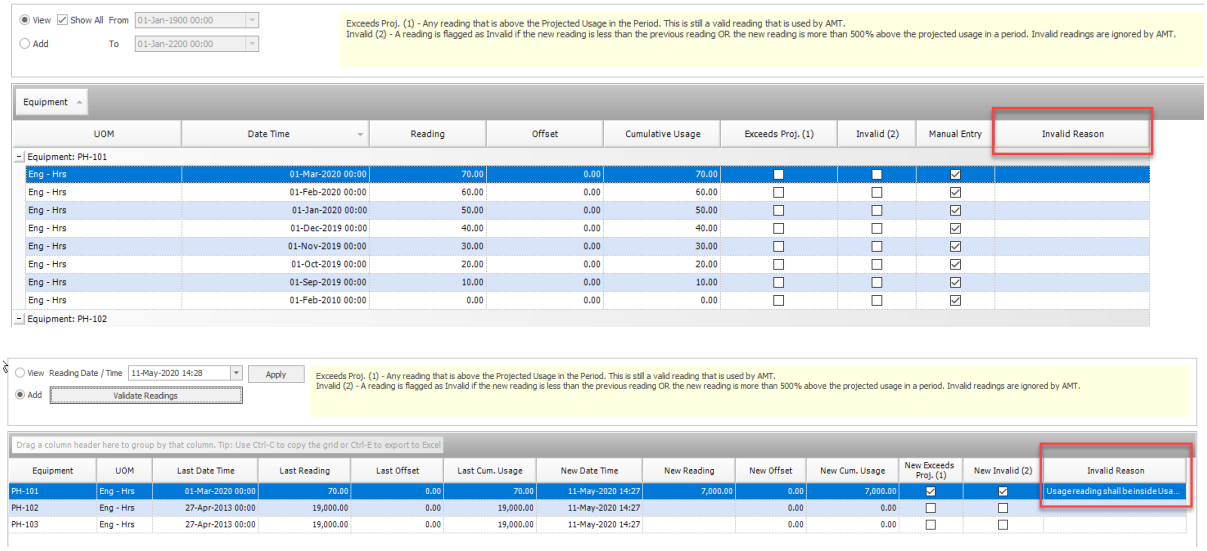

Enhanced Record Actual Usages : Work Item 31008

The **Daily Operations** > **Record Actual Usages** process has been enhanced, with a new column, Invalid Reason, that will display a message explaining the reason for an Invalid Record. This gives you an opportunity to review the reason and make any necessary adjustments to correct if it results from a data entry issue.

The column will be populated on **Save** or **Validate** when manually creating records. The column will not populate as you manually update multiple records in the one screen, as the database record isn't saved and logic triggered until the screen information is saved.

When the AMT Client is not used to load records and the information is received from an external source, records will be processed through the database routine and therefore any invalid entry reasons are visible in **View** mode.

New column exists at the end of the data entry and review screens.

Messages received for Invalid Records are as follows:

- Usage reading exceeds the maximum allowable growth tolerance (xxx%)
- Usage reading is less than the previous reading (Reading - Reading date)
- Usage reading exceeds the end usage (xxx)
- Usage reading is greater than the next existing usage reading (reading - reading date)
- Duplicate usage reading [Existing reading: Equipment = "xx", QUOM = "xx", ReadingDate = "xx"]

Fixes

The following is a list of all issues resolved.

Functional Area	Fixes	Work Item
Business Intelligence (Cubes)	The Business Intelligence (Cubes) processing rules have been updated to exclude data that does not pass data integrity rules. In previous releases, any violation would result in the entire cube processing process to fail.	27857
	Fixed an issue affecting installations using SQL Server 2012 where the IC Operations processing job would fail when running the following two jobs: • IC_Extract_Dim_User_WO_Planning_Status • IC_Import_Dim_User_WO_Planning_Status	30190

Functional Area	Fixes	Work Item
Builder G3	Some customers have encountered **Builder G3** input files containing duplicated repair options. While this should not normally occur, when it does, AMT will display a cryptic error message and refuse to process the file. In this version, AMT will display a message showing the details of the duplicated repair options data and advise the duplicate needs to be removed.	20625
Workorder Settlement Code Translation	Filtering for a specific translation codes and performing a deletion no longer results in the unintended deletion of other translation codes.	29785
Dashboards	Sites now display on web dashboards correctly.	29202
Depreciation	Monthly depreciation is now calculated correctly if assets are being processed by the Dynamic Lifecycle Costing process.	30564
Events	The actual downtime and the actual hours in an Event downtime allocation now match.	30907
	Fixed an issue in **AMT** > **Planning** > **Events** where applying a filter would not clear any previously supplied grid search value. This behavior would give the appearance of the data in the grid not matching the value(s) in the grid search area. In this release, applying a filter on the **Events**, **Workorders** and **Backlogs** tabs now clears any manually entered grid search values.	30916
Parts Forecast Report	The **Parts Forecast System Task** no longer fails to run under certain circumstances, and data is now shown in the Parts Forecast **Report**.	30277
Planning	Fixed a filtering issue in **Daily Planning** > **Planning** > **Scheduling** tab where setting a start date might not result in all work orders that start on the start date being included in the results. Inclusion of a specific work order depended on the start time of the work order. In this version, the start time of work orders is not considered.	30715
Standard Jobs	Changes to **Standard Jobs** can now be saved after attaching a Document Link or Library Documemnt.	30608
Strategy Tasks	The **Next Due - Component Details** dialog now shows settlement details related to date-based strategy task work orders.	30876

Functional Area	Fixes	Work Item
Suppression Logic	The next occurrence within a sibling suppression group now calculates correctly in all circumstances.	30555
Usages	The usage date for a manually entered usage no longer defaults to 24 July 2018 00:00. In this release, the current date/time is the default.	30513
Warranty	An error no longer occurs when pressing the **Submit Warranty** button on the **Work Order** > **Warranty** tab.	30233
Work Orders	Improved the wording of the warning message displayed when creating a purchase order with no parts or miscellaneous items in the purchase order, or when the purchase order has been created by another user.	30276
	Fixed an issue where: 1. An attempt is made to create an ERP Work order via the **Create ERP Work Order** button. 2. The work order was not created because of an error. 3. The error is corrected and the **Refresh** or **Save** buttons are clicked. 4. An error message appears, indicating the **Work Order Header** could not be saved.	30394
Performance	Improved the performance of the projected task import process.	30388
Integration	The process to create an external work order is no longer called in response to creating an **Event** from a backlog/new work order.	30668
	The **Send Purchase Order** transaction is no longer cancelled when an empty work order number is returned, when AMT is configured to not require a work order number.	30524
	The work order **ERP Created By** attribute is now populated for work orders that are sent to an external ERP system.	30568
	The external work order number (if defined) is now included in the message sent to an external ERP if AMT is configured in PO Mode.	30221

Functional Area	Fixes	Work Item
Recalc	Improved an issue where recalc performance could suffer when many settlements required processing.	30806
	Updating a strategy task date or usage in **Long Term Planning** now correctly updates strategy task occurrences.	31062
Reports (Mobile)	All custom **Quoter** reports now display the correct name in the mobile client.	30689
Reports (Asset Utilisation)	In the **Asset Utilisation Report**, downtime values are no longer being rounded to a whole number. In this release, downtime values are displayed to two decimal places.	29316

Version 8.19 U1

The following is a list of all changes and updates addressed in AMT Version 8.19 U1.

Overview

The major changes between AMT Version 8.19 and 8.19 U1are as follows.

- The external ERP Work Order reference is no longer saved as part of a generic work order save/ refresh process.
- Fixed an issue where any existing external work order number was not included in the message sent to an ERP when AMT was configured in Purchase Order mode.
- Fixed an incompatibility between two Cube processing packages and SQL Server 2012.
- Included two missing Cube processing packages.

Issues Resolved

The following is a list of all issues resolved.

Functional Area	Description	Work Item
Work Orders	This update resolves an issue where, under specific circumstances, saving a Work Order could clear the link to an ERP work order. The scenario was: 1. **User A** opens work order X. Work order X has not been linked to an ERP and does not have an external ERP Work Order reference. 2. **User B** also opens work order X. User B clicks the button to create the work order with an ERP. The ERP link occurs, and the ERP Work Order number is saved against work order X 3. **User A** makes changes to work order X and saves the work order. A message is displayed to User A indicating that another user has made changes to work order X, and that continuing will overwrite those changes (in this case, those made by User B). User A chooses to continue with the save process, which overwrites the external ERP work order number with 'blanks'. This results in removing the link to the ERP work order In this release, the ERP Work Order field on an AMT work order is not updated in any way when the AMT work order is saved/refreshed. The only way to insert/remove a value in the ERP Work Order field is via the Create/Unlink ERP work order buttons on the Work Order editor. This change will stop unintended clearing of the ERP Work Order field value.	30185
Integration	Fixed an issue where any existing external work order number was not included in the message sent to an ERP when AMT was configured in Purchase Order mode.	30222
Cubes	This release fixes an issue where the following two packages were not compatible with SQL Server 2012 (users of other supported versions of SQL Server were not affected): 1. IC_Extract_Fact_Workorder.dtsx 2. IC_Import_Fact_Workorder_HOLD.dtsx	30191
Cubes	This release fixes an issue where the following two packages were missing from the AMT 8.19 installation. 1. IC_Extract_Dim_User_WO_Planning_Status.dtsx 2. IC_Import_Dim_User_WO_Planning_Status.dtsx	30192

Version 8.19

The following is a list of all changes and updates addressed in AMT Version 8.19.

Overview

The major changes between AMT Version 8.18 U1 and 8.19 are as follows.

- Depreciation usability and functionality improvements.
- Labour Activity Filtering in Daily Planning.
- Ability to include time in Bulk Printing filtering.
- Work Order Deletion controls.
- Equipment Description is now exposed on several reports.
- Added Branch Code as an attribute of an Employee.
- Changes to Plant Hire Rates are now logged and reportable via the new Plant Hire Audit report.
- Added Cost Bearer as a filter to several reports.
- Standard Job Version Control reportable via the new Standard Job Version Details report.
- Ability to add documents to standard job operations.
- Improvements to Work Order document linkages.
- Redesigned Life Cycle Cost Summary @ Cost report.
- New report: Workload Optimisation.
- Improved Dynamic Life Cycle Costing Engine performance.
- Improved About box.
- Bug fixes.

Enhancements

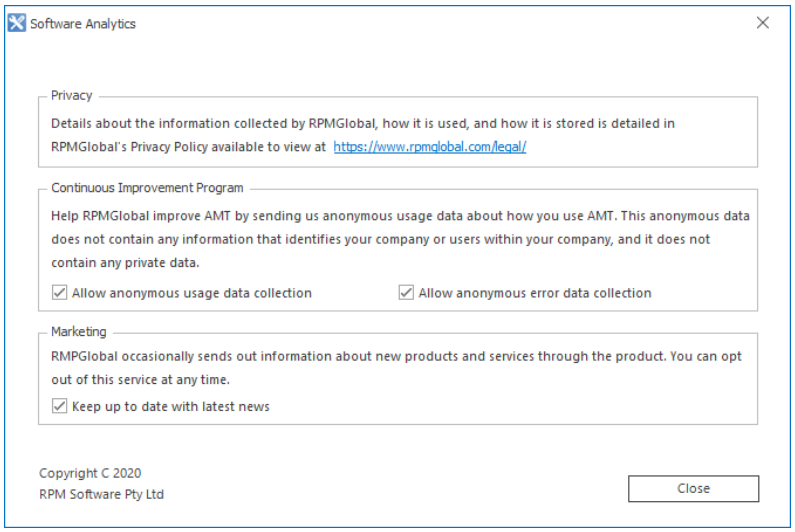

The following are the change requests and enhancements addressed in this release.

About

Work Item : 28063

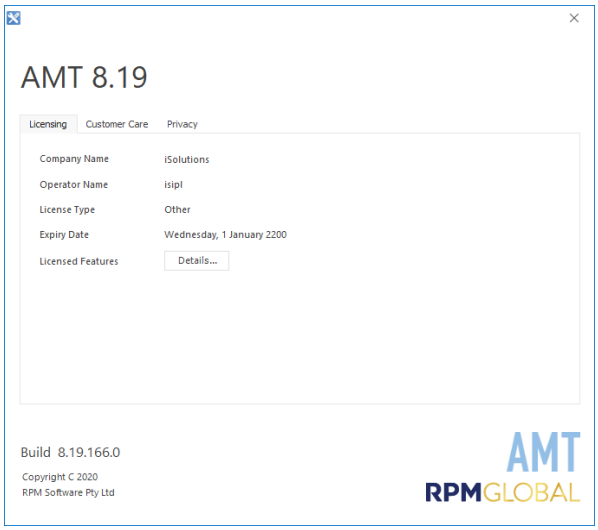

AMT 8.19 includes a newly designed **About** box and **Software Analytics** screen. AMT Software Analytics now includes a new option in the Marketing section allowing individual users to opt in to receive marketing updates directly through AMT.

The first time you start AMT, and no choice has yet been made, the Software Analytics dialog box is displayed. Select the **Keep up to date with latest news** option to opt in to marketing updates. Clear the check box to opt out.

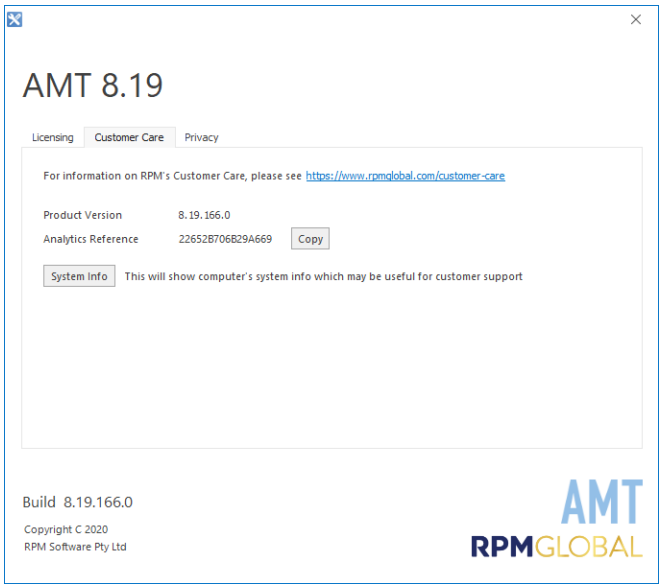

The About box has been redesigned to provide easier access to:

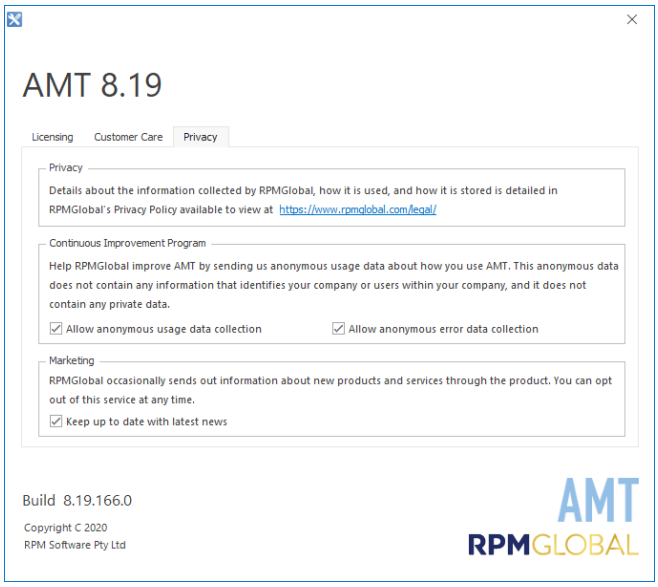

Licensing Information

Customer Care Information

Privacy Settings

Depreciation

Work Item : 28982

In previous versions it was not possible to dispose of an asset unless it had a Depreciation Strategy Task and, for a fully written down asset (or component), a Depreciation Strategy Task could not be created.

In AMT 8.19, this requirement is relaxed. You are now able to dispose of assets when a Depreciation Strategy Task does not exist. This will support the disposal of assets or components that have been previously depreciated in another solution prior to asset recognition in AMT. Asset and component information needed to be included in AMT for reconciliation between solutions.

Work Item : 29387

Following the introduction of depreciation recognition for assets and components in AMT 8.17, being able to associate a component's Deprecation Strategy Task with an associated Component Changeout strategy task was identified.

AMT 8.19 allows a Strategy Task to be flagged as having a capital component and depreciation.

AMT 8.19 allows the generation and association of the Future Forecast Deprecation Strategy Tasks for the projected changeout occurrences.

With a strategy task flagged as having related deprecation, you will be able to see any associated depreciation strategy tasks.

The current Deprecation Strategy Task will have both actual and forecast depreciation as time progresses. Future Forecast Deprecation Strategy Tasks will only have forecast depreciation.

Future Forecast Deprecation Strategy Tasks will create monthly forecast depreciation for the life of that component.

For example:

An engine is recognised for deprecation purposes on a truck. It has a life of 20,000 hours and actual depreciation calculates each month based on the actual engine hours recorded for that month. An initial engine hour forecast is known for the truck's usage profile; this will forecast deprecation if usage based.

Available from 8.17:

1. AMT supports the recognition of the engine's capital cost and depreciation rate by recognising the engine's capital cost as a depreciable asset and then creating a current live deprecation strategy task.
    a. At the beginning, before the machine is used, the live deprecation strategy task will create monthly forecast depreciation based on the usage profile and the component's expected life.
    b. As the machine is used, actual usage readings are recorded. Each month, deprecation is calculated based on either straight line or the usage rate as identified on the live deprecation strategy task.
    c. The capital will be depreciated over the component life; it cannot be over-depreciated (for example, beyond 20,000 hours) unless revalued. If revalued, the depreciation rate is adjusted and applied to the outstanding depreciable amount at the time of revaluation.
    d. A capital component with an LDST can also be:
        i. Made inactive for a period of time (depreciation stops until the time the asset is reactivated).
        ii. Transferred (for example, moved from one truck and installed in another as an example). Actual usage for the depreciation calculation needs to be sourced from this new truck going forward versus the previous one.
        iii. Split into smaller assets which then supports the transfer or sale of some of these smaller components.
        iv. Disposed (sold or scrapped) with the appropriate profit or loss recognition while understanding whether the disposed component was fully written down or not.

Available from 8.19 onwards:

1. A strategy task can be flagged for depreciation forecasting. Generally, but not necessarily always the case, this strategy task would be a changeout activity.

   A strategy task flagged for depreciation forecasting will then auto-generate the future forecast deprecation strategy tasks; the future forecast deprecation strategy task start will coincide with the projected changeout occurrences.

   a. You can see associated future forecast deprecation strategy tasks and current and historical live deprecation strategy task information from the planned strategy task for the changeout.

      It is not mandatory for strategy tasks to have depreciation. It is a business decision whether to implement asset depreciation and any associated forecasting for component replacements.

2. AMT continues to support the copy projections process. However, the copy projection process has ‘rules’ introduced for integrity purposes when accounting for the deprecation related strategy tasks.

   Refer to AMT Help and AMT Depreciable Asset Training documentation for specific details.

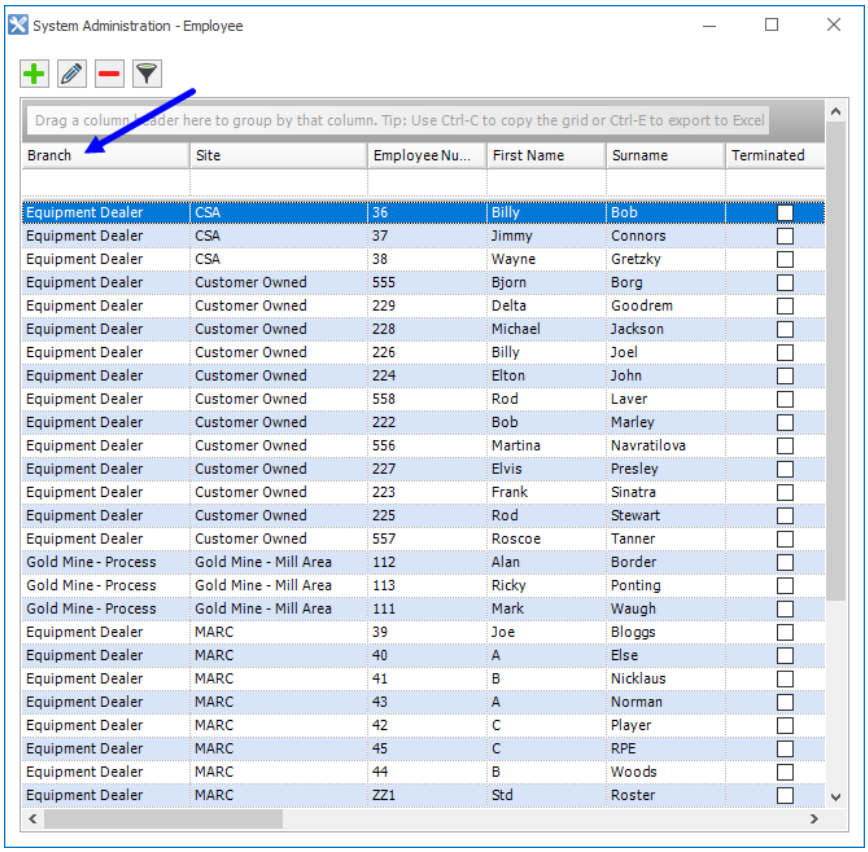

3. AMT continues to support the copy strategy task process. However, the copy strategy task process has ‘rules’ introduced for integrity purposes when accounting for the deprecation related strategy tasks.

   Refer to AMT Help and AMT Depreciable Asset Training documentation for specific details.

Employees

Work Item : 27678

To make it easier for customers with large numbers of Employees defined in AMT, a new attribute, **Branch**, has been added to the Employee entity. In addition, a Branch column, which you can filter, sort and group, has been added to the **Employee System Table**.

Equipment

Work Item : 26054

When saving equipment that includes a change to the primary unit of measure, the following rules have been introduced for data integrity:

Simple Utilisation: Unit of measure changes are not allowed if usage records of the same type already exist. This applies for records other than the start usage value.

Advanced Utilisation: No unit of measure change is not allowed if the new Usage Profile doesn't include the existing referenced unit of measure from the actual usages. This applies for records other than the start usage value.

Work Item : 28463

For consistency with the planning functionality within AMT:

1. The **Equipment Editor** > **Tasks** tab tasks grid **ST Description** column caption is changed to **Description**.
2. The **Equipment Editor** > **Tasks Editor** tab tasks grid **ST Description** column caption is changed to **Description**.

Integration

Work Item : 28616

Improved the quality of information in error messages returned to external systems when importing usages via the AMT EPF Adapters. Errors now include the full error description, reading date and actual reading value of the offending value.

Work Item : 28495

The **Create ERP WO** button on the Work Orders dialog box is now disabled once clicked. It is only re-enabled if an error message is returned from the ERP, or any external work order reference is unlinked.

Note that it is still possible to click the **Create ERP WO** button for the same work order under the following conditions:

1. A single user has two or more instances of the same work order open at the same time. They click the **Create ERP WO** button in the first instance, and then in the second.
2. Two users (user A and B) are editing the same work order at the same time. User A clicks the **Create ERP WO** button. A moment later, user B clicks the **Create ERP WO** button. User B will see a warning message advising the work order has been changed by another user, and that continuing will overwrite those changes. If user B ignores this warning, user A's changes (including any external ERP work order number supplied by the ERP) will be overwritten.

Work Item : 28938

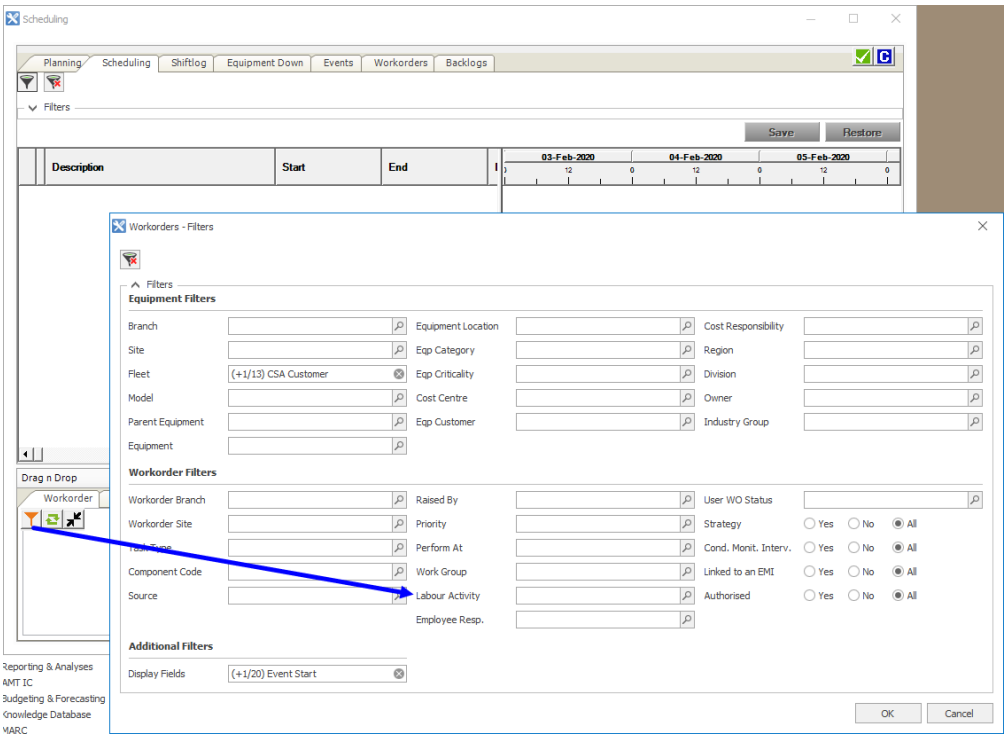

Improved the performance of the **Import Work Order Summary** integration point.

Planning

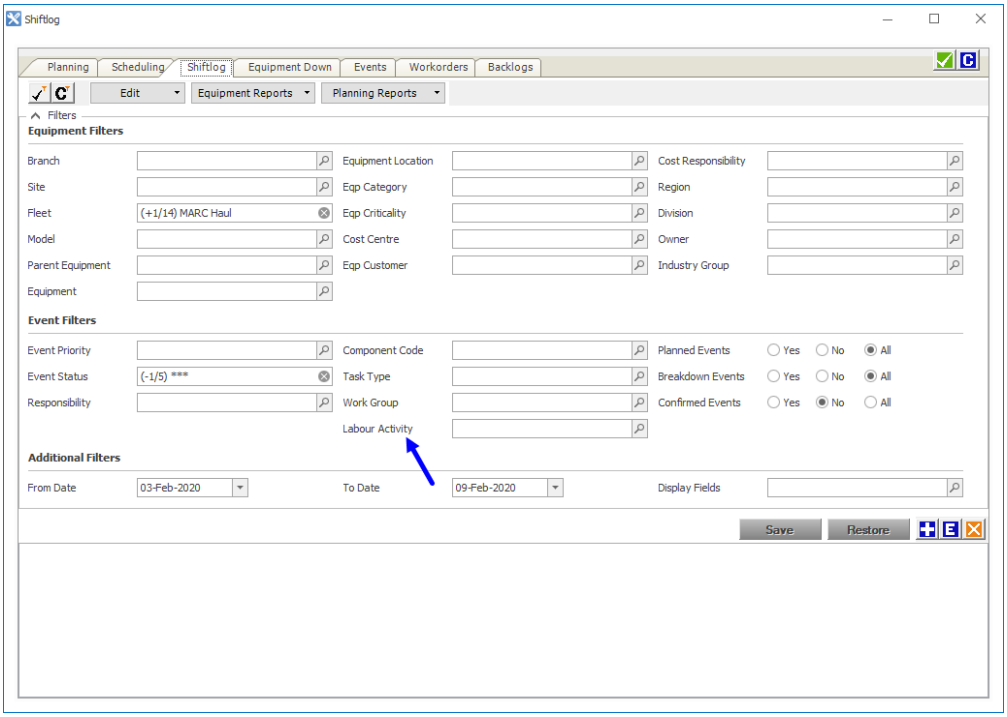

Work Item : 29522

To assist users, AMT 8.19 includes the ability to filter by Labour Activity in four additional places in **Daily Planning** > **Planning**:

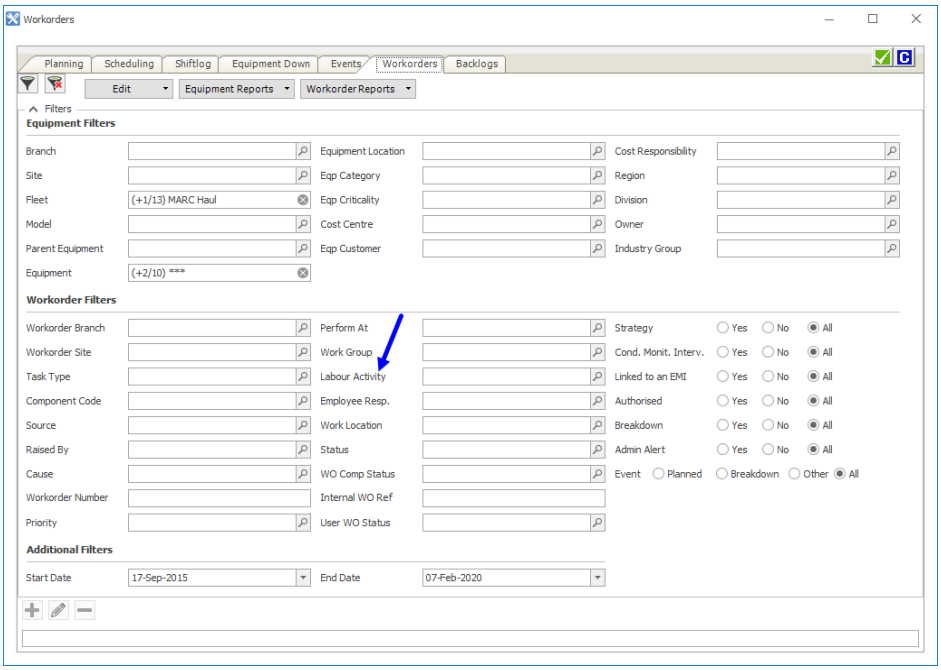

1. **Daily Planning** > **Planning** > **Scheduling** tab.

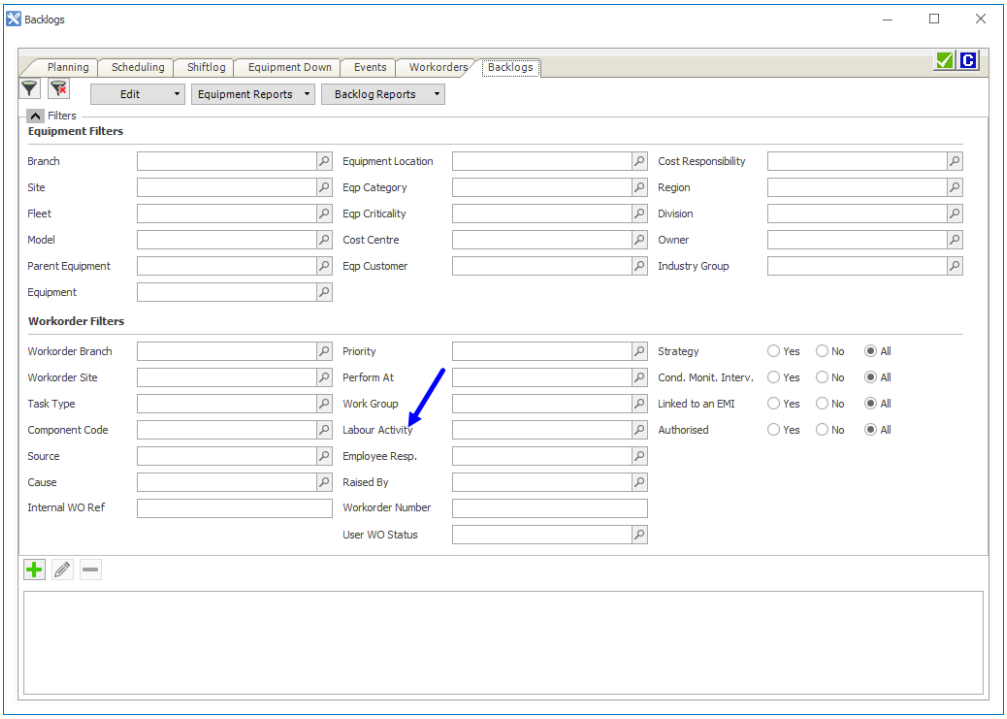

2. **Daily Planning** > **Planning** > **Shift Log** tab.

3. **Daily Planning** > **Planning** > **Work Orders** tab.

4. **Daily Planning** > **Planning** > **Backlogs** tab.

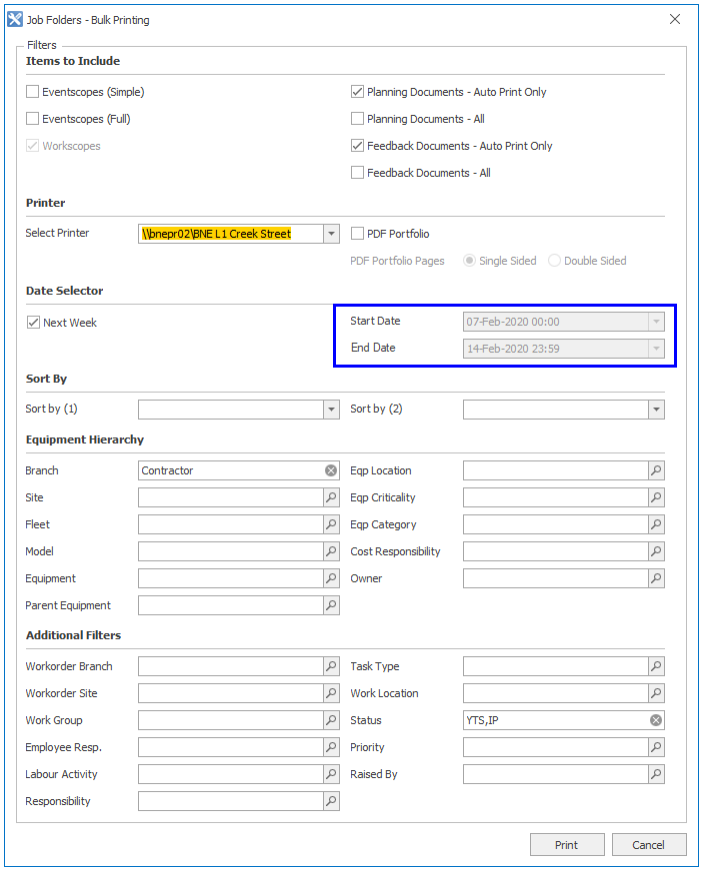

Printing

Work Item : 29528

In previous releases, the **Job Folders - Bulk Printing** function only allowed work orders to be filtered by date, not date and time. This meant it was not possible to exclude work orders from the bulk printing process that might be associated with a specific shift start or end time within a given day.

In AMT 8.19, the **Date Selector Start** and **End Date** controls have been extended to include the time. The **Start Date** time defaults to 00:00, and the **End Date** time defaults to 23:59. This ensures default behavior is unchanged from previous versions.

Recalc

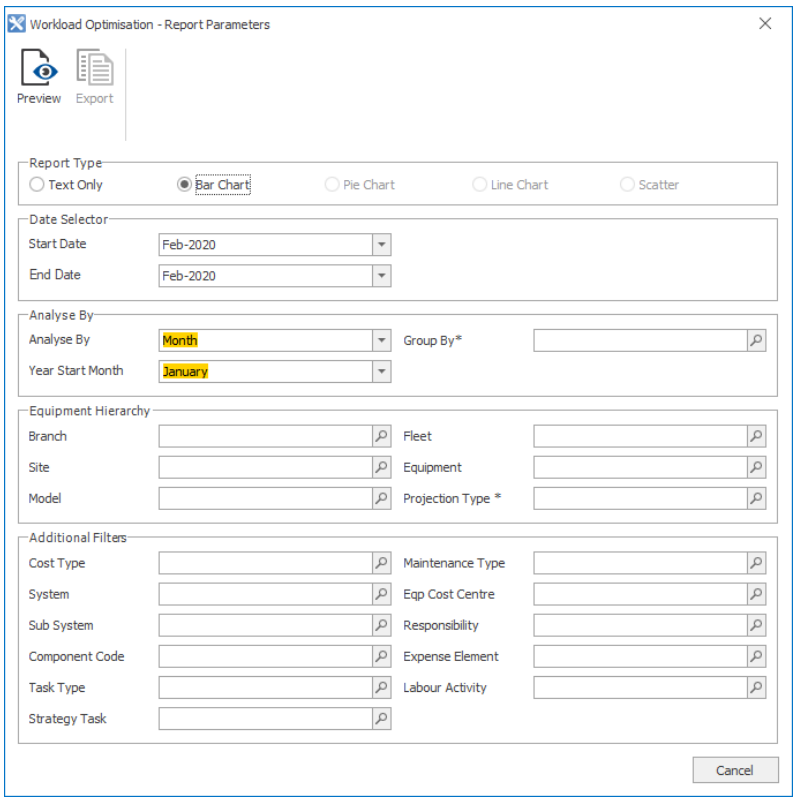

Work Item : 28615

Improved the performance of the **Dynamic Life Cycle Costing Engine**.

Reports

Work Item : 27270

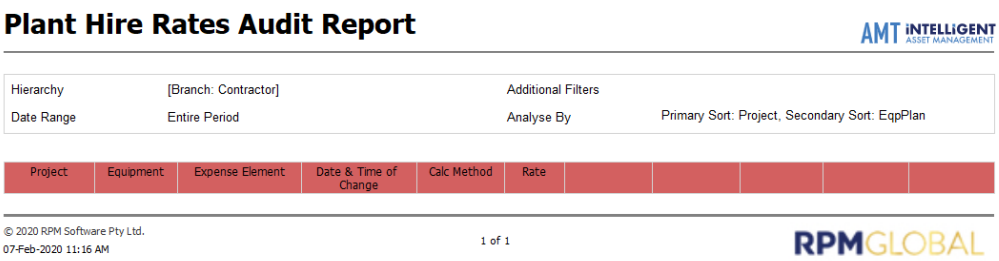

A new report, **Work Optimisation**, has been added to AMT 8.19. The Workload Optimisation report is similar to the existing Labour Forecast Hours report, but includes a multi-select **Projection Type** filter. It also includes the ability to group by Projection Type.

Work Item : 27210

A new report, **Plant Hire Rates Audit** report, has been added to AMT 8.19. With long running projects for equipment, escalations of plant hire rates are common. In addition to being able to calculate project margins from revenue and costs, it is important for AMT to keep a record of when project hire rates were escalated. In previous versions of AMT, any new rates will overwrite previously held rates if the new rates are calculated outside of AMT and imported. This has led to customers creating entire new projects each time the rates change with associated transfer of equipment to the new project and the import of the new rates. This is time consuming and inefficient.

In this release, an audit record is created whenever rates are changed. The Plant Hire Rates Audit report shows the details of these audit records.

Work Item : 27419

Four reports have been extended to include the **Equipment Description** Field. This was done to make it easier to identify equipment for those customers who include additional key information in the equipment description field:

1. Workscope - Single Operation.
2. EventScope - Header (Unplanned Event).
3. Operation WorkScope - Single Operation.
4. Workscope Summary - Multiple Operations.

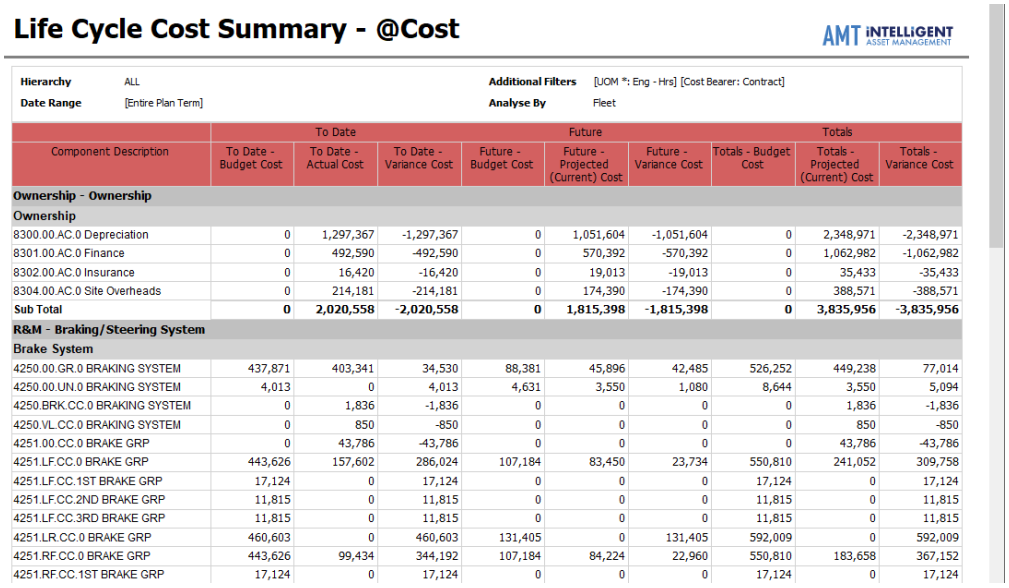

Work Item : 26108

Three reports have been extended to include **Cost Bearer** as a filter:

1. Life Cycle Cost Summary.
2. Life Cycle Cost Summary - @Cost.
3. PCV Analysis.

Work Item : 26584

The Life Cycle Cost Summary - @Cost report has been redesigned to reduce wrapping and other pagination issues.

Life Cycle Cost Summary - @Cost

Work Item : 28003

Reports now display the AMT Intelligent Asset Management logo.

AMT iNTELLiGENT ASSET MANAGEMENT

Work Item : 28267

The messaging has been improved when the **Forecast Availability Report** is run and includes results for more than one availability type. The Forecast Availability Report will only display if the information is for one availability type. In AMT 8.19, the message **Availability Type is not common** has been changed to:

The selected filter combination will result in more than one Availability Type being returned. This report can only display one Availability Type. Please adjust your filter and try again.

Work Item : 25248

The **Unassigned Cost Analysis** report reports on ERP (integration) component codes by default. This is different to other cost reports, which report on AMT component codes. AMT codes refers to the fact that on a settlement there are two sets of codes for component code, modifier code, task type, job code, application code, occurrence type and a few others as well. One set of codes is prefixed in the database by AMT and come from the AMT entity the settlement is linked to. The other codes come from the integration data sent from the ERP. Of these codes, the unassigned costs report uses component code, modifier code and task type.

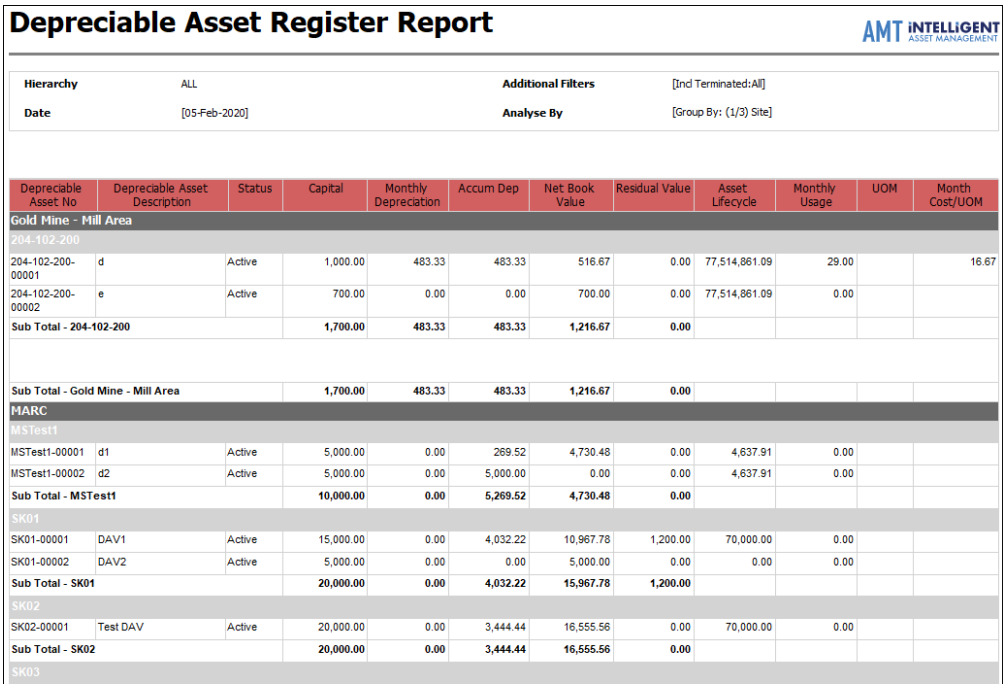

In AMT 8.19, the report has been extended to allow reporting on either ERP Codes OR AMT codes. The report defaults to ERP (integration) codes to ensure continuity of results for existing users. If AMT code is chosen, the component code, modifier code, task type, cost type, system and subsystem will be determined using the AMT codes for the settlement. This applies to the **Analyse By** options as well as the additional filters.

Work Item : 28452

The Depreciable Asset Register Report has been re-designed to improve usability:

1. Changed the Depreciation column to Monthly Depreciation.
2. New columns were added:
    a. Depreciable Asset Description.
    b. Status.
    c. Net Book Value (Capital - Accumulated Depreciation).
    d. Asset Lifecycle (Total Usage Value from Depreciation Strategy Task).
    e. Monthly Usage.
    f. UOM.
    g. Depreciation Rate (shown in Month Cost/UOM).

3. Includes the ability to group and sub-total the report on **Site**, **Fleet**, and **Model**.

Standard Jobs

Work Item : 28352

To aid in the identification of Standard Jobs, the globally unique **Standard Job Number** is now exposed in various locations within AMT. The standard job number is a read-only, system generated number assigned to every standard job in AMT.

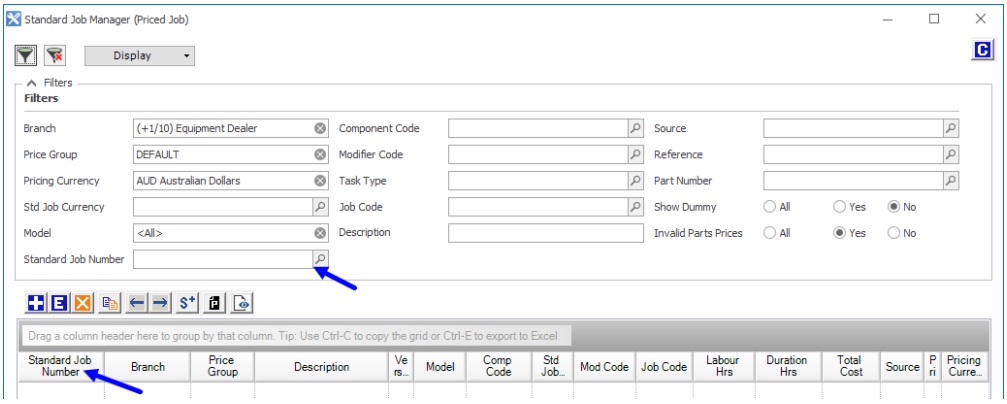

The standard job number works in conjunction with **Standard Job Version Control**, also introduced in AMT 8.19. See Standard Job Version Control elsewhere in these release notes for more information.

The standard job number has been exposed in the following areas:

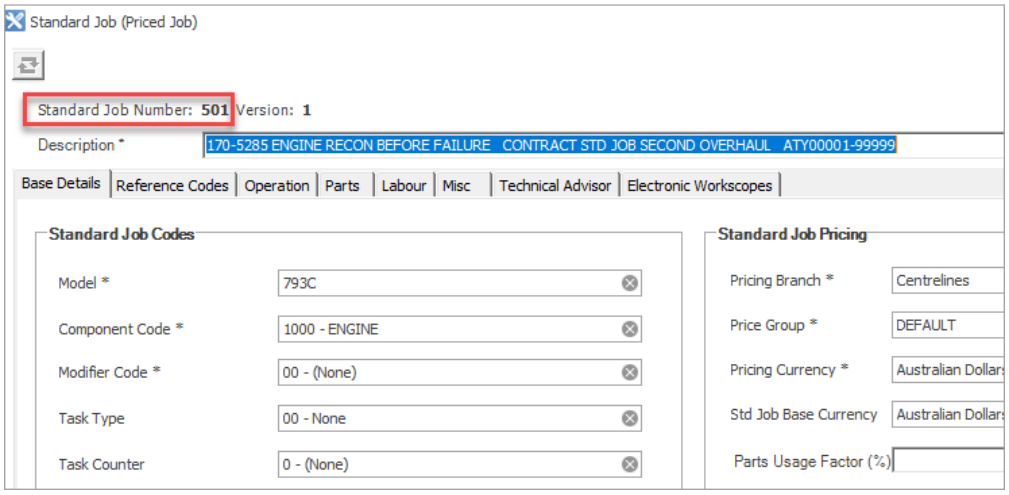

Standard Job Manager

- Filter.

- New grid column.

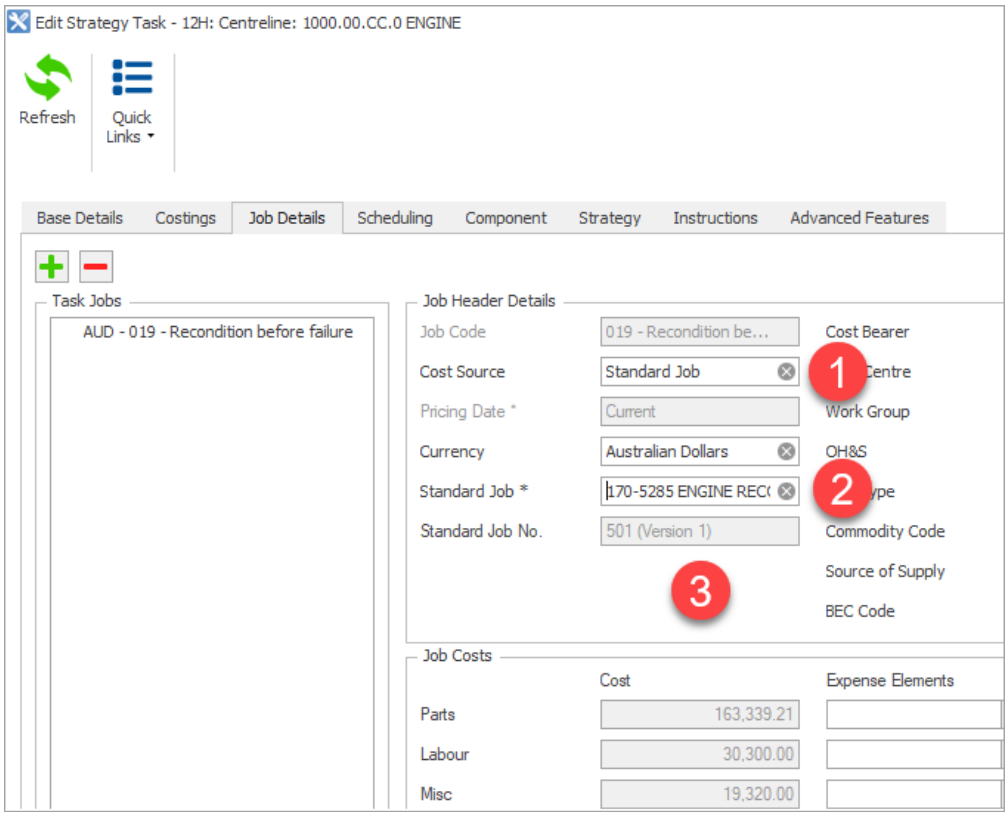

Standard Job Editor

When copying a standard job using the **Copy** button on the Standard Job Manager, the copied standard job will have its version number incremented.

Strategy Task Editor

If the **Cost Source** is **Standard Job**, and a standard job is selected, the Standard Job Number is now shown.

PM Standard Jobs Report

Standard Job Number displays in the report header.

Work Item : 29018

AMT 8.19 introduces **Standard Job Version Control**. Each time a change is made to a standard job, its version number is incremented. The version number can be seen wherever the new Standard Job Number is visible. See Standard Job Number elsewhere in these release notes for more information.

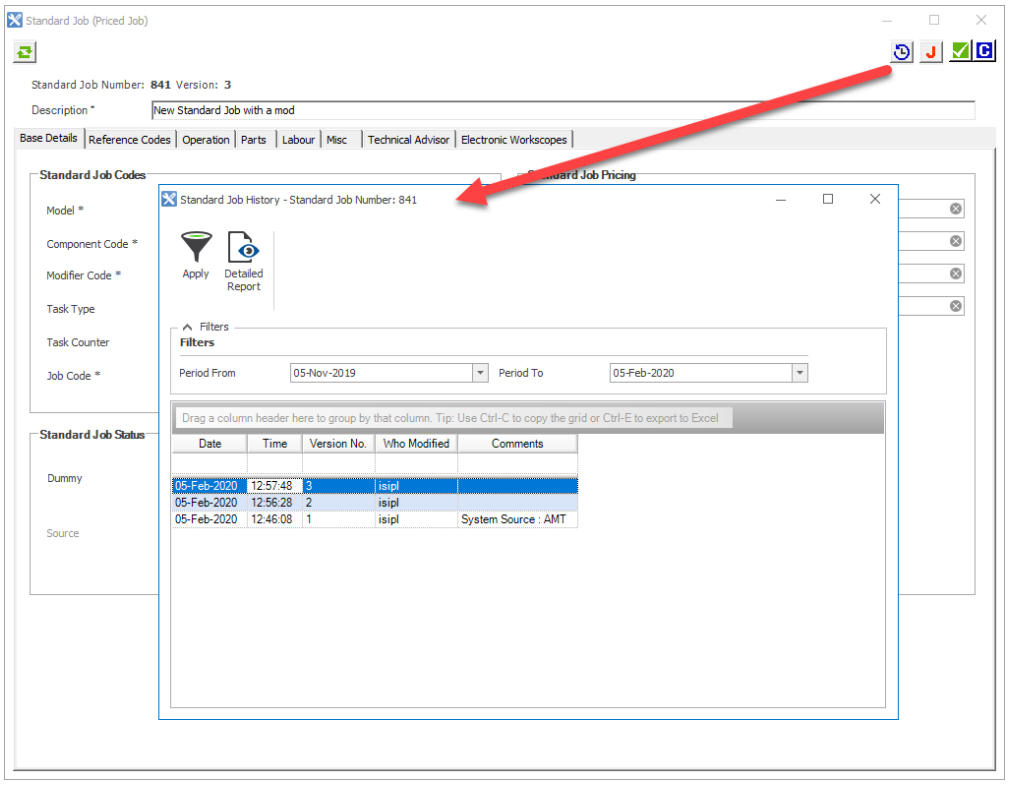

In previous versions, AMT allowed any standard job to be modified by any personnel who have access. There is no record kept of how many times an individual standard job is modified, or what changes were made to the standard job.

In AMT 8.19, a new version attribute has been added to the Standard Job entity. During an upgrade or new installation, existing standard jobs are given a version number of 1. Each time a change is made to a standard job, the version number is incremented and the details of what was changed (and by whom) are logged.

The current version number of a standard job can be seen in all places where the new Standard Job Number field has been exposed.

Standard Job Version Form

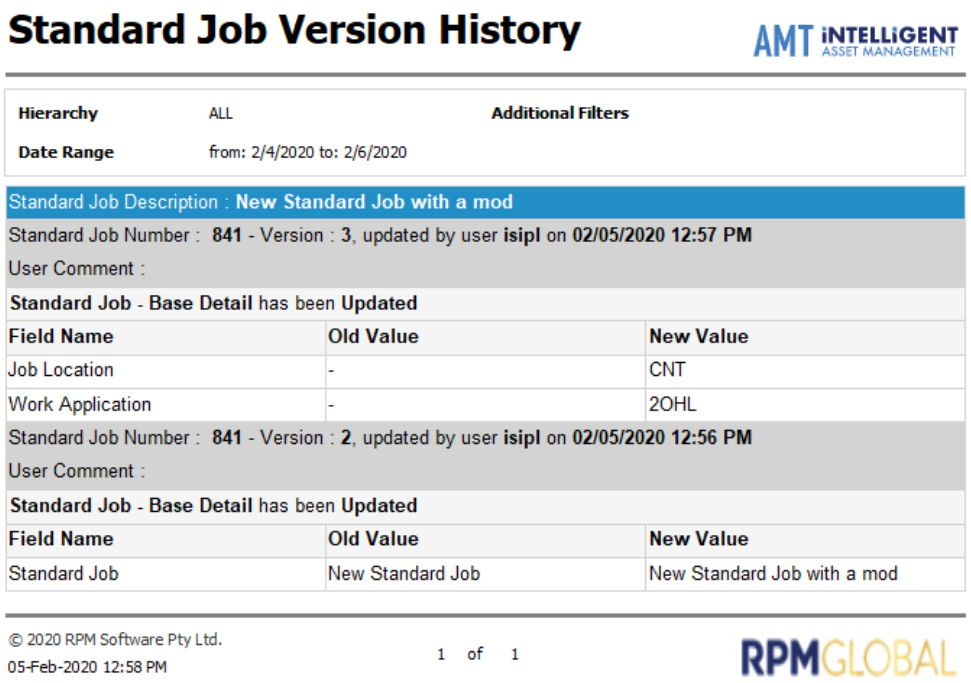

The standard job editor has been extended with a new toolbar button that displays a form showing a summary of all logged changes. The toolbar button is only visible if changes exist:

Clicking the **Detailed Report** button on the history form causes the new **Standard Job Version History** report to be executed.

Standard Job Version History report

A new report has been added to AMT – the **Standard Job Version History** report. This report shows a detailed log of all recorded changes for one or more standard jobs:

Standard Job Version History

AMT INTELLIGENT ASSET MANAGEMENT

Hierarchy	ALL	**Additional Filters**

RPMGLOBAL

The Standard Job Version History report can be accessed from the **Standard Job History form**, from the grid in the **Standard Job Manager**, or directly from the **AMT Function selector**.

Logging behavior, including forcing users to enter a comment whenever a standard job is changed, is defined in AMT configuration. See the M310 configuration document for details, or contact RPM Global Customer Care.

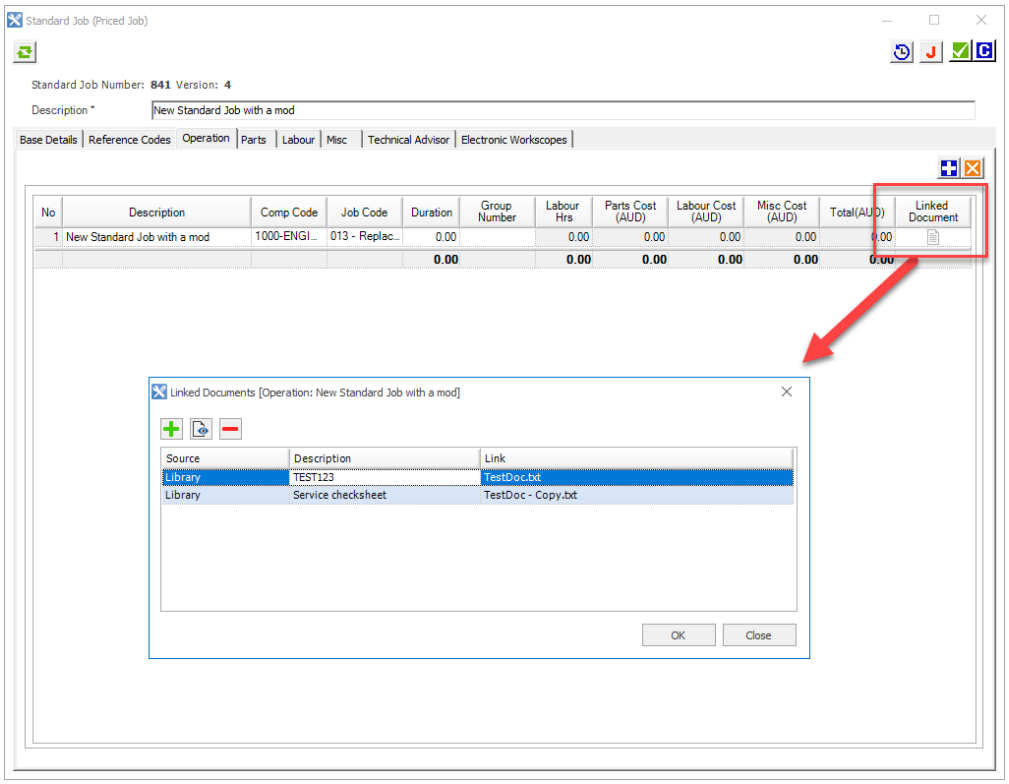

Work Item : 28560

In previous versions of AMT, it was not possible to add one or more documents at the operation level to standard jobs.

In AMT 8.19, it is now possible for a Standard Job operation to reference one or more documents. These documents will be inherited by any strategy task associated with the standard job or any work order created from the standard job.

If a document is added or deleted, the version number of the standard job is incremented.

The **Standard Job** > **Operation** tab has been extended to include a **Linked Document** column. Clicking the icon in this column causes the Linked Documents dialog to display. From here documents can be linked and unlinked to the standard job operation. Linked documents can also be viewed.

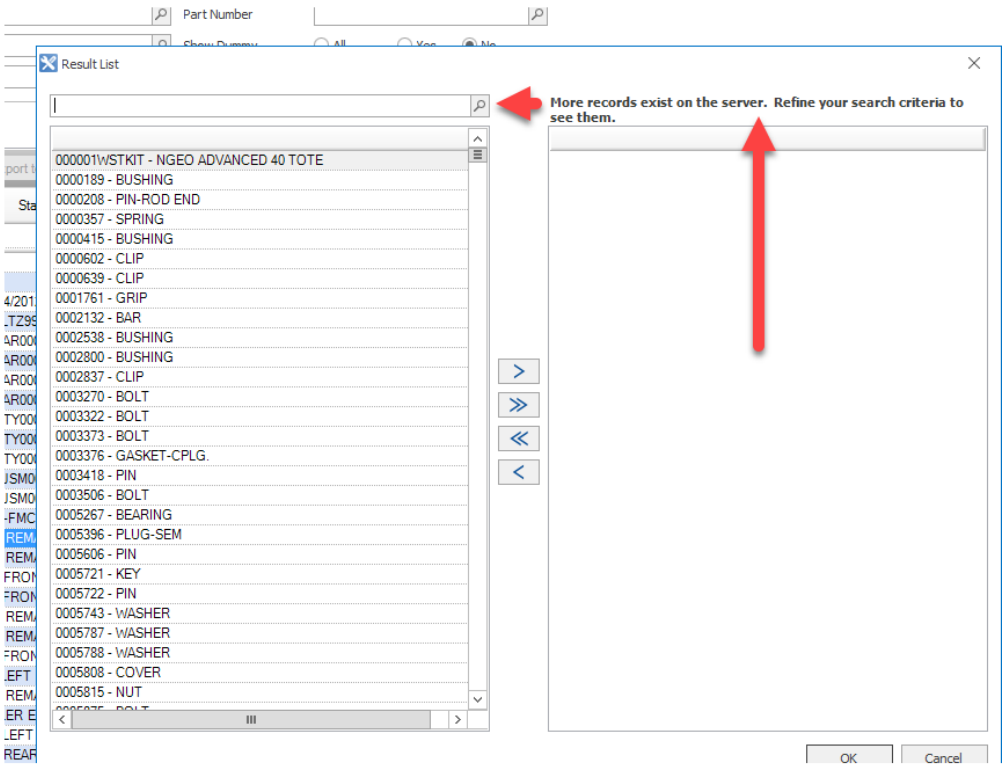

Standard Job Manager

Work Item : 27895

The **Parts** lookup dialog on the **Standard Job Manager** has been extended to support very large result sets. In previous versions, attempting to load the multi-search control with a very large number of items could result in very slow performance or an application error.

In this release, the Parts lookup dialog will load up to the number of records defined in the **SearchMaxRows** value of the **AMT_TYPED_VARIABLE** settings table. If more parts are available, a message is displayed at the top of the parts Result List advising more parts are available and to refine your search criteria to see them all. When this message is displayed, refine your search criteria by entering part information into the search box above the parts list:

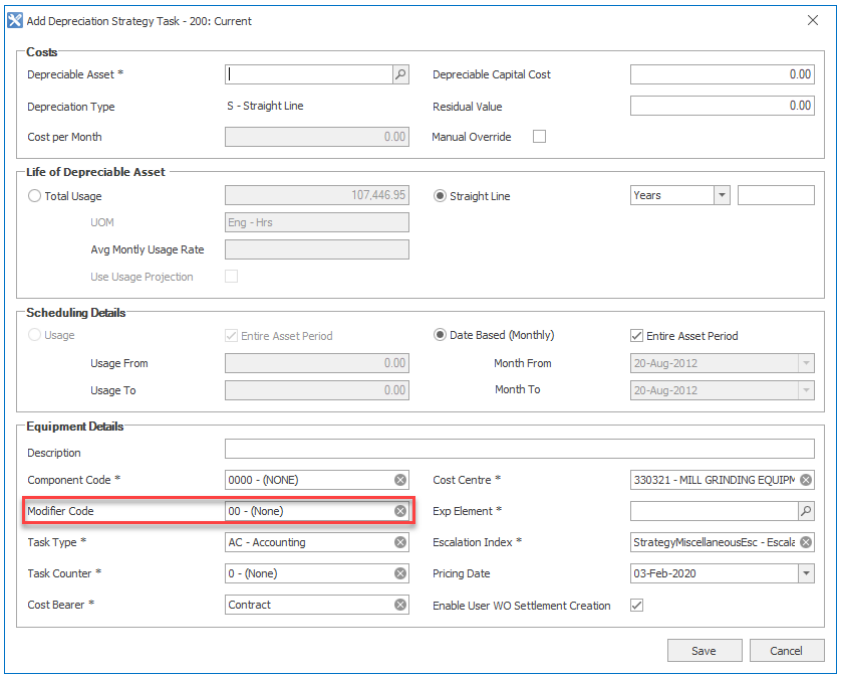

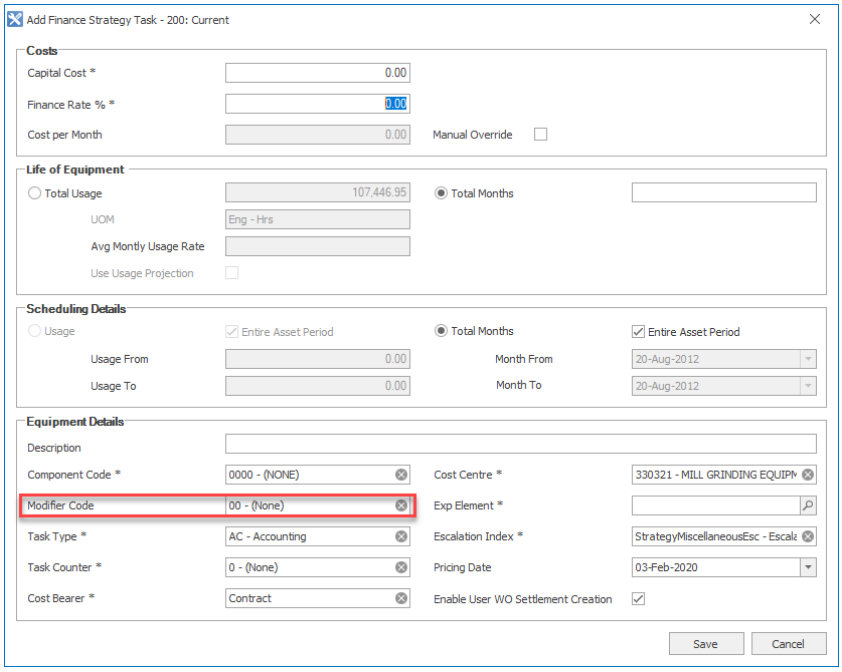

Consult the M310 Configuration document for information about the **SearchMaxRows** value in **AMT_TYPED_VARIABLE**, or contact RPMGlobal Customer Care.

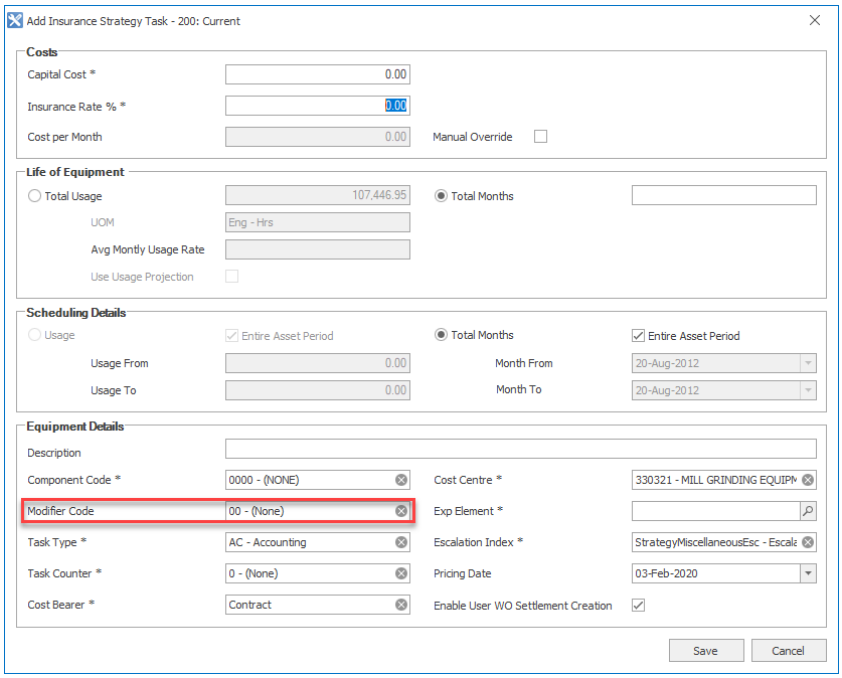

Strategy Tasks

Work Item : 27353

The Modifier Code field has been exposed on the **Depreciation**, **Finance** and **Insurance Strategy Task** dialogs:

Work Item : 26757

It is now possible to delete **unassigned strategy tasks** from the **Strategy Task Manager**.

Work Orders :

Work Item : 29336

Historically, AMT supports work order deletion. No security exists across the work order deletion process. A user with access to Daily Planning can create, modify and delete work orders.

When AMT is integrated with an external ERP, the work deletion process needs to remove any work order disconnect between the two solutions. An AMT-ERP solution should disable the option for work order deletion within AMT. In an integration solution, AMT work orders would be typically be closed (or completed) or abandoned.

To support this scenario, new configuration options have been introduced that allow manual AMT work order deletion to be disabled.

Work Order deletion is controlled by a combination of two configuration settings. If both settings are TRUE, user interface elements that allow work order deletion will be disabled.

The following configuration settings are stored in table AMT_TYPED_VARIABLE:

Name	Description	Default	Notes
IsIntegratedWithERP	Boolean value indicating if the AMT instance is integrated with an ERP system	0	If this record does not exist, or has no value, assume False (0).
IntegrationCreatesERPWorkOrders	Boolean value indicating integration creates Work Orders in an ERP system.	0	If this record does not exist, or has no value, assume False (0).

AMT 8.19 applies the following logic using these settings:

- Check *IsIntegratedWithERP* config.
  - = **True**
    - Check *IntegrationCreatesERPWorkOrders* config.
      - = **True**
        - Disable Work Order deletion action/menu/quick link.
      - = **False**
        - Existing behaviour.
  - = **False**
    - Existing behaviour.

The following work order deletion points will be disabled if configured:

Daily Planning > **Planning** > **Planning** tab

- Edit menu > Delete Workorder menu option.
- Delete Workorder button on top of grid.
- Grid Delete Workorder context menu.

Daily Planning > **Planning** > **Backlog** tab

- Edit menu >Delete Workorder menu option.
- Delete Workorder button on top of grid.
- Grid Delete Workorder context menu.

Daily Operation > **Workorder Settlement Closure**

- Delete Workorder button on top of the grid.
- Grid Delete Workorder context menu.

Daily Planning > **Workorder Authorisation**

- Delete Workorder image on top of the grid.
- Grid Delete Workorder context menu.

Consult the M310 Configuration document for information about IsIntegratedWithERP and IntegrationCreatesERPWorkOrders, or contact RPMGlobal Customer Care.

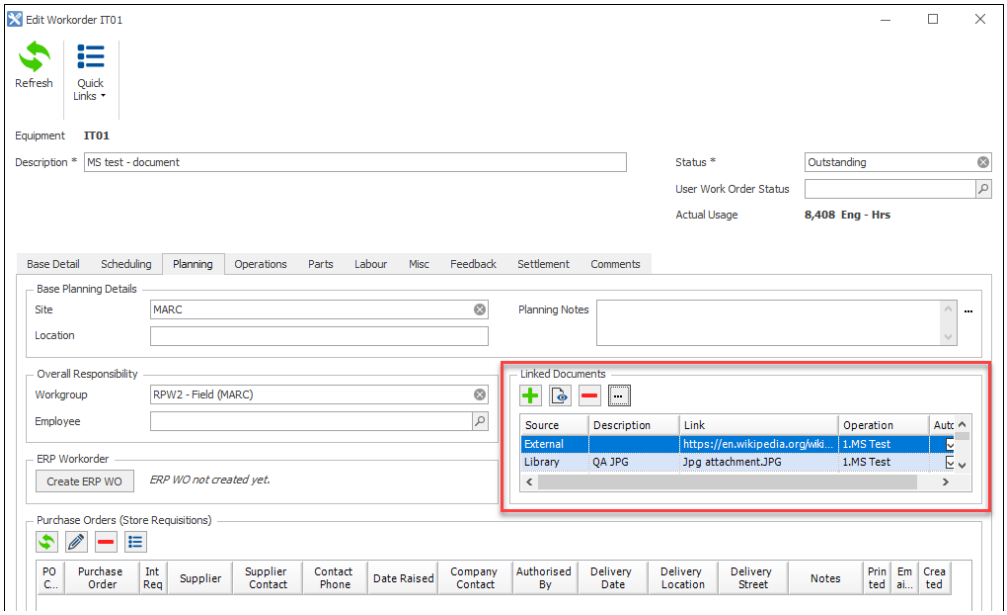

Work Item : 29048

In AMT 8.18 and earlier, work orders could not have the same document linked multiple times. In AMT 8.19, it is now possible to have multiple operations linked to the same library document. This can be done manually, or automatically when a work order is created from strategy task that contains document links.

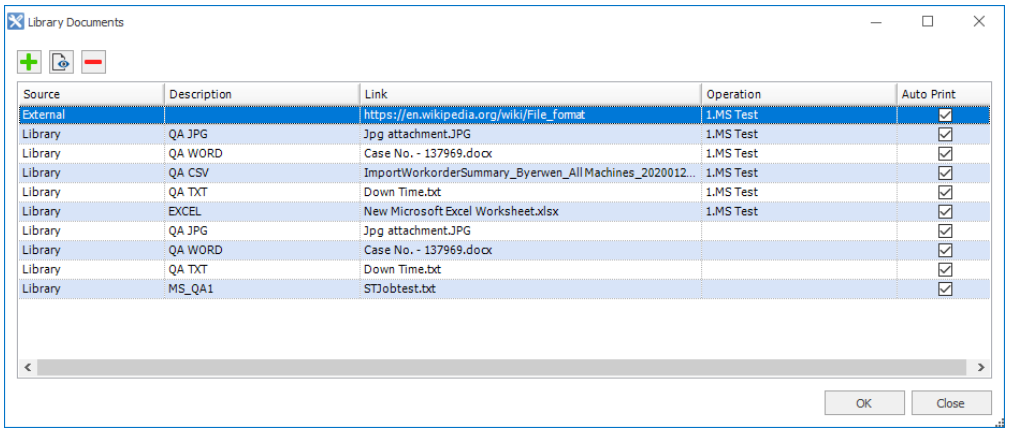

Work orders created from a strategy task where the strategy task job(s) have associated documents now include those documents in the operation(s) created. This means on a strategy task with two task jobs where task job one has associated document X and task job two has associated document Y and Z, the work order will be created with two operations where Operation one has an associated document X and Operation two has associated documents Y and Z.

Work orders created from a standard job, where the standard job has three operations each with two associated documents, will have three operations each with two associated documents.

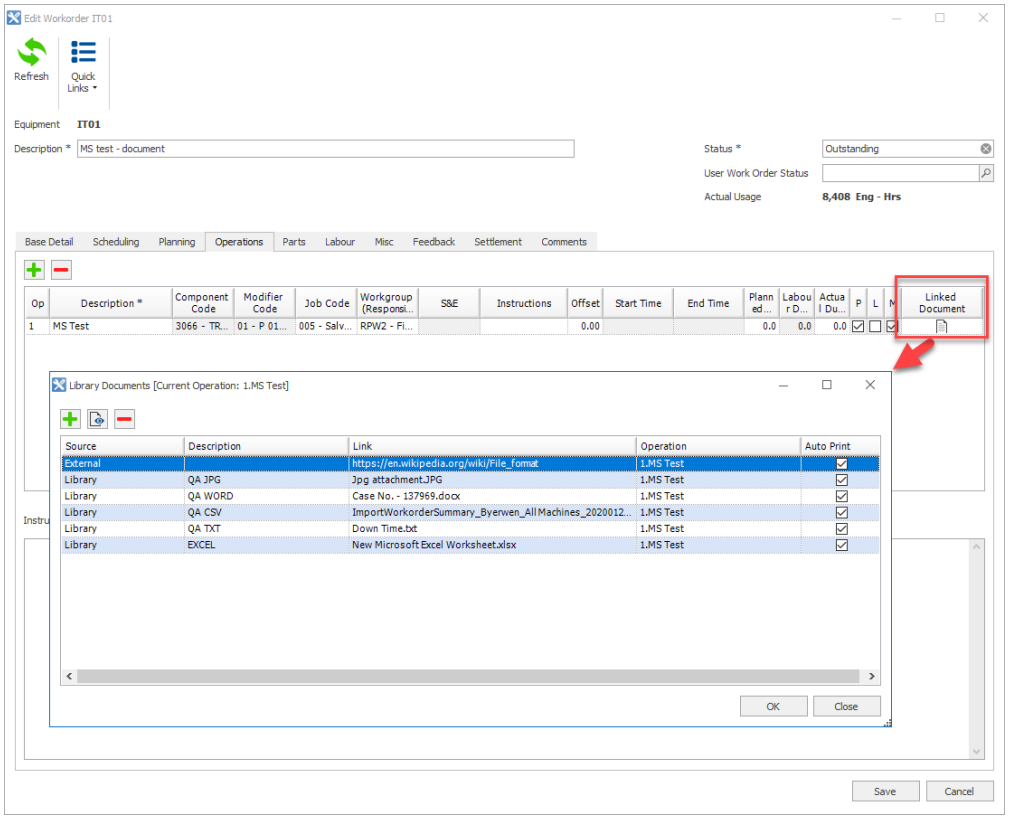

If a work order is created from a strategy task, and the strategy task has three task jobs, with task job two referencing a standard job with two operations each with two associated documents, will have four operations. The first operation will be associated with task job one from the strategy task; operations two and three will be created with from the standard job and will inherit the two associated documents at each level, the fourth operation will relate to strategy task job three.

Clicking the **[…]** button displays the **Library Documents** dialog. The Library Documents dialog makes it easy to manage all linked documents.

From the **Work Order Operations** tab, the new Linked Document column icon will display linked documents associated with the selected operation only:

Issues Resolved

The following is a list of all issues resolved.

Functional Area	Description	Work Item
Authentication	Invalid codes in user settings data no longer cause AMT to fail to authenticate.	27135
Billing	**Billing schedules** without any billing steps are now visible and able to be edited.	27891
	There is no longer an error when copying billing schedules.	27891
Budgets	Improved the performance of adding equipment to a budget.	27250
Dashboard	Clicking the **First Stoppage after PM** section of the Dashboard no longer results in an error.	29001
	Fixed an issue where, under very specific circumstances, clicking a Defect work order on the dashboard could open defect work orders for a different piece of equipment.	27281

Functional Area	Description	Work Item
Depreciation	The **Final Lifetime Usage** field on the **Dispose Depreciable Asset** screen now accepts values with up to two decimal places of precision.	28245
	Fixed an issue where making retrospective changes to actual usages required the user to re-open and re-process all previous financial periods. In this version, retrospective changes are balanced at the time the most recent financial period is processed.	27271
	It is now possible to modify a depreciable asset's description after it is created.	29004
	Fixed an issue where the monthly depreciation calculation was using an average number of days per month (365.25 / 12). In this release the actual number of days per calendar month are used.	29024
	It is now possible to load a depreciable asset where the Capital Value – Accumulated depreciation = Residual value.	28801
	Fixed the following issues in the **Depreciable Asset Register** report: • Removed unnecessary blank pages. • Updated the report logos. • Fixed wrapping issues. • The column headers now display on each page.	28929
	Monthly usage-based depreciation calculations now stop at the last actual usage reading for the month.	29280
Downtime	It is no longer possible to record downtime for re-build work orders.	29181

Functional Area	Description	Work Item
Equipment	Using the **Select Copy and Create Equipment** function no longer creates a new piece of equipment with the same end date as the source equipment.	28842
	The **Unassigned Ratio** value is now copied to the new equipment.**Copy and Create Equipment – Modelling**.	27400
	Fixed an issue where copying Real equipment to a Modelling equipment (configured for plant hire) could fail with the message "Plant Hire Rates are not in the equipment term". In this release, plant hire rates for the period hire that are common between the source and destination are copied.	28205
	Fixed an issue in the **Equipment Tree** where nodes would be duplicated and displayed out of order. In this release no duplication occurs and nodes are displayed alphabetically.	26964
Functional Location	AMT now remembers the numbers of Display Levels specified in the **Functional Location Manager**.	27245
Integration	Fixed an issue where using the file and web service 'classic' interfaces to import work order summary where component code '0000' would result in a silent exception in the **Windows Event Log**.	28188
	Fixed an issue where, depending on the data, a standard jobs export generated by AMT would result in an encoding error when importing the same data back into AMT.	27266
	Fixed an issue in the **Next Occurrence Export** where comments data could be lost if the comments contain hard returns. In this release, hard returns are removed during the export process, ensuring all data is exported.	27840
	Fixed an issue with the classic **Import Usage Readings** where a file containing invalid readings (that is, where the supplied usage could not be matched to an existing model + serial number) would go to the Success folder whereas it should have gone to the Failure folder. **Customers who are using the EPF Adapters method AssetStatisticsIntegrationService:ProcessUsageReading() must upgrade AMTAPI to version 8.0 or higher.**	28796

Functional Area	Description	Work Item
Permissions	The **Edit Group** dialog has been updated to clarify the purpose of the 'Default Role', and to ensure one role is always designated as the 'Default Role'. Specifically: • The **Default Role** check box has been renamed to **System Administrator Role**. • The role with System Administrator Role selected is disabled, and cannot be cleared. • Checking the System Administrator Role check box on any other role will make that role the System Administrator Role and clear any previously selected role. The Edit Group dialog now looks like this:	
Planning	Attempting to save from the **Work Order Planning** tab where the work order **Work Location** field containing an EM dash no longer results in an error.	26976
	Adding a new **Event** via the **Express Create New** function now uses the default **Activity** as specified in the Activity system table.	24993

Functional Area	Description	Work Item
Planning	Fixed an issue in the **Sales Status** dialog box where some users with the appropriate permissions where unable to add parts.	25094
	Improved the performance of the **Assign Supplier** function within the parts tab.	27590
	Setting the **Strategy Date** of equipment in the **Long-term Planning** grid to a future date no longer results in an error.	27733
	Fixed an issue where some orders seen on the **Work Orders** tab were not seen on the **Scheduling** tab.	27803
	Fixed an issue where the target date on non-planning tasks was incorrect (it was correct when the task was opened directly).	27804
	Fixed an issue where under some conditions the **Update Planning** system task would become unresponsive.	28489
	In the **Plant Hire Rate Audit** report, checking the Entire Period option no longer results in the selection automatically (and erroneously) changing to Last Month.	29672
	Fixed an issue where the **Bulk Printing** feature equipment search facility would include Modelling equipment. In this release only Real equipment are returned.	28206
Recalc	Importing data into the work order external source id field that contains certain characters no longer causes the recalc process to fail.	28834
	Fixed an issue where, under specific circumstances, copying strategy tasks could cause the recalc process to stop.	27815
	Fixed an issue where deleting unscheduled strategy tasks could, under certain circumstances, cause recalc to stop.	25955

Functional Area	Description	Work Item
Reports	The **Timesheet Cost Analysis** report no longer fails to execute if the source data contains specific control characters.	28571
	The **Maintenance Compliance** report line charts in the bottom half of the master report are now rendered correctly.	28410
	The **Labour Resource Scheduling and Utilisation** report no longer returns a No Data message when in fact data is available.	28438
	Fixed an issue where some reports would give filter access to Branches the current user did not have access to.	27997
	In the **Equipment Expiration** report, attempting to group the results by Site no longer results in an error.	28004
	In the **Labour Hours per Interval** report, the value for labour hours per interval is now correct.	28304
	The **Product Support Component Status** report can now be run on a computer configured to use the Russian locale.	28288
	Fixed an issue where the **Parts Usage Analysis** report could fail under data-specific circumstances.	26994
	The **Parts Demand Analysis** report now shows parts with a system generated date (as opposed to a manually set date).	27128
	Fixed an issue where the **Total Cost Worksheet – Modelling** report did not display a prompt indicating that projections need to be recalculated. In this release, the prompt is displayed if necessary.	24455
	Fixed an issue where the **Changeout Schedule** report would not return any results when only the **Branch** filter was supplied.	23565

Functional Area	Description	Work Item
Reports	The **Budget Forecast Performance** report no longer shows zero actual costs if a budget is using a currency with an ID other 1.	27352
	The **Availability Snapshot Worm** report no longer produces an error if data to be reported on contains the single quote character (‘).	27488
	The **Asset Cost Worksheet – Modelling** report no longer fails when run against a very large set of sites.	27507
	The **Long Term Planning** report no longer fails on a computer configured to use a comma (,) as the decimal symbol.	27469
	The **Component History** report no longer produces an error when supplying a serial number to the report filter.	29040
	Fixed an issue with the **Availability** report where selecting the options **Breakdown** and **Planned** would result in downtime being reported as 0. In this release, the correct downtime value is returned when both options are selected.	28937
	Changed the tips shown for the **Plant Performance KPI** report to clarify that only date (not date and time) is selectable.	29695
	Fixed an issue where **Availability** reports projected usages didn’t consider usage steps exclusions.	27878
Settings	The **Defined Maintenance Period** system table editor is now available.	28020
Strategy Tasks	Users are no longer able to copy **Strategy Tasks** to equipment they do not have access to.	24366
	Fixed an issue where some **Statutory** strategy tasks were failing to produce work orders.	27048
Strategy Tasks	Labour hours shown in the **Strategy Task Analyser** are now the same value as the values in the **Work Order Settlement Manager**.	28190
Timesheets	Timesheet entry dates (**Daily Operations** > **Timesheet**) are no longer displayed out of order.	27691

Functional Area	Description	Work Item
Usages	In this version, attempting to delete a UOM from a Usage Profile with actual usages of the same type will now display the following message: **This UOM cannot be deleted because actual usages of this type exist**.	28107
	Fixed an issue where importing invalid usage values in the **MeterReading** field (file drop or web service) would result in the actual usage cumulative value being incorrect. In this version, Actual Usage is set to the Meter Reading value + offset.	28317
Work Orders	Hard return characters embedded in employee names no longer causes the employee selector to be rendered incorrectly.	28048
	The **Dealer Financial Mode** where **Workorder Editor** > **Planning** tab > Purchase order **Quick Links** option is no longer disabled.	27828
	Fixed an issue where work orders that were created with no parts specified had the **Job Ready Status** set to **Parts Not Ordered**. In this release, newly created Work Orders with no parts specified are created with a Job Ready status of **Not Ready**.	27448
	Fixed an issue where changing the status of a work order to YTS resulted in the **Planned Start Date** and **Actual Start Date** to change to a date in 2018. In this release, Planned Start Date and Actual Start are set to the current date.	27393
	Clicking the Work Order Editor '**X**' icon to close the editor now prompts you to save any changes that have been made to the work order. Resizing the work order editor form no longer obscures the **Save** and **Cancel** buttons.	27476
	Warranty information (**Warranty Usage**, **Warranty Days**) are now inherited from the Strategy Task when manually creating Work Orders from Strategy Tasks.	26640
Work Orders	The data sent to an ERP in response to clicking the **Create ERP WO** button now specifies the username of the user who pressed the button.	29945
Work Orders	Fixed an issue in the **Eventscope – Header (Planned Event)** report where only the first task was included. In this release all tasks in the event are shown in the report.	29244

Version 8.18 U1

The following is a list of all changes and updates addressed in AMT Version 8.18 U1.

Overview

The major changes between AMT Version 8.18 and 8.18 U1 are as follows.

- Added Equipment Description to WorkScope and EventScope Reports.
- Bug fixes.

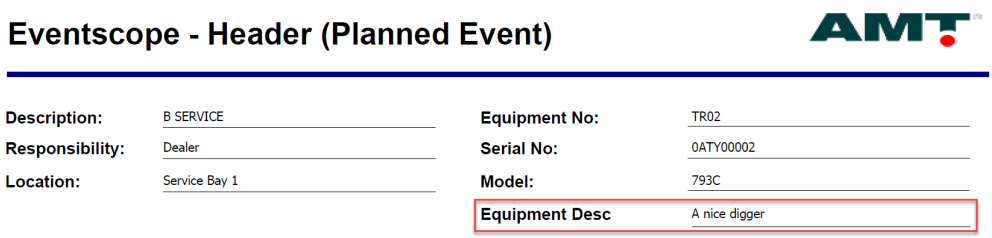

Enhancements

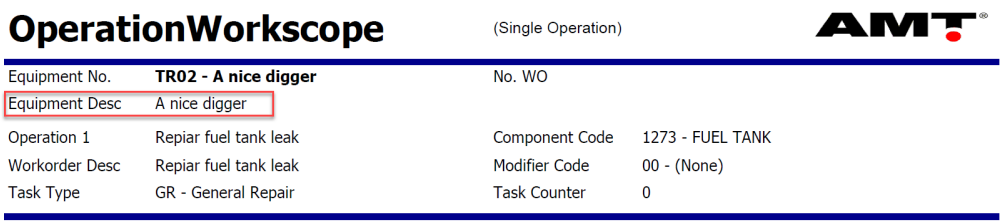

The following are the change requests and enhancements addressed in this release.

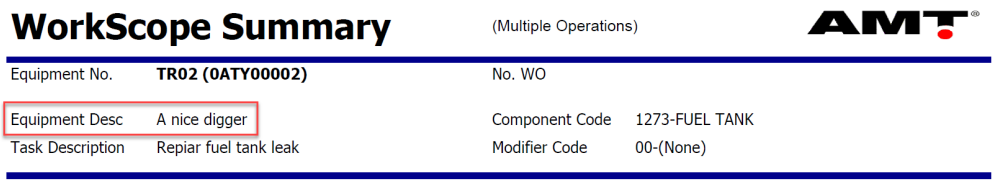

Reports

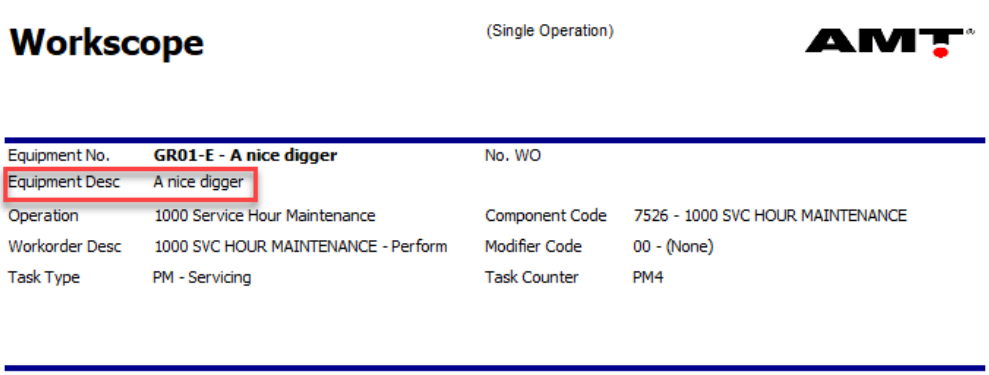

Work Item : 27456

This release includes the **Equipment Description** field in the reports shown below. In some cases, minor layout changes have been applied to maintain and improve balance.

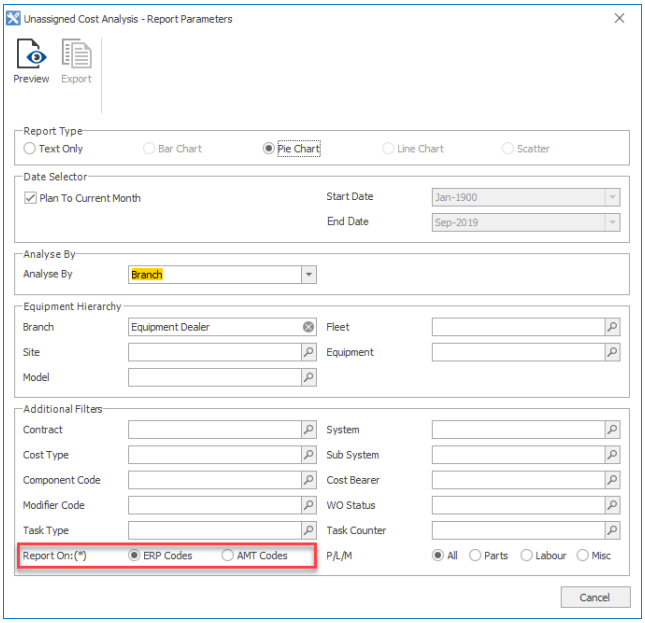

Issues Resolved

The following is a list of all issues resolved.

Functional Area	Description	Work Item
Billing	Duplicate key errors no longer occur while copying a billings schedule.	27891
Depreciation	The manual override setting for usage-based tasks now displays the correct value in the user interface when the strategy task is closed and re-opened.	27598
	When you enter usage values into the **Depreciation Strategy Task Editor** using decimal notation, the decimal values are now displayed when the strategy task is reopened.	28078
	Resolved an issue in the **depreciation calculation**, so now, when adding usages values after a depreciation period has been closed, there is no longer a discrepancy between AMT and external systems.	27437
	Saving an item of equipment in the **Depreciable Asset Editor** without a residual value no longer causes an exception.	27662
	A prompt to save changes no longer displays in the **Depreciation Strategy Task Editor** if there have not been any changes made.	27668
Equipment	**Creating Modeling Equipment from Centerline Equipment** now copies over the **Unassigned Ratio** value.	27415
Functional Location	In **Functional Location Manager**, the Display level setting is now persisted, so you do not have to specify the desired level each time you open the form.	27247

Functional Area	Description	Work Item
Planning	An exception is no longer raised in **Long term Planning** if an attempt is made to change the Strategy date.	27737
	Non-planning tasks no longer show an incorrect target date. In this version, target date is derived from the **Performed By Date** instead of Strategy Date.	27805
	Improved the performance of the **Assign Supplier** function.	27624
	The incorrect **Ready Status** is no longer used when creating work orders from strategy tasks. It was set to Parts Not Ordered even when there were NO Parts.	27496
Printing	The **Print Job Folder** function no longer raises an error if the option selected is EventScope (Simple) OR EventScope (Full).	27441
	The **Print Job Folder** function no longer displays the No Data message when printing to a physical printer, even though the print preview is displaying results.	27362
	Custom Quoter reports can now be loaded.	27227
Strategy Tasks	The target date in newly created strategy work orders no longer show the create work order date.	27131
	The Last scheduled UOM/Date of the strategy task, **which is scheduled on last scheduled**, may sometimes be invalid.	27197
	In this release, the AMT Modifier code is exposed on the Depreciation, Finance and Insurance Strategy Task forms.	27356
Work Orders	In this release, the **Work Order Editor** form displays in the middle of the screen. In previous versions, each new instance would display to the right of, and below, any previous instance. This was resulting in the Save and Cancel buttons to be obscured for some reason.	27484
	Editing a **Work Order** by changing its state to YTS no longer causes the Scheduling Start Date and Time to default to a date in 2018.	27395

Functional Area	Description	Work Item
Integration	Importing occurrences no longer results in an error.  This only occurred for users with very large databases.	27206
	The **Create Work Order** integration will now send newly added parts to a connected ERP if the Work Order has been saved since the new parts were added.  This issue only affects customers using the AMT EPF Adapters.	27319
Mobile	Reports in **Quoter** no longer display with broken titles.	28038
Recalc	A **Defined Maintenance Period** no longer results in the Recalc process failing.	27304
Reports	In the **Budget Forecast Report**, the Actual/Current Projection column no longer displays $0 if the budget uses a currency that is not the default currency.	27384

Functional Area	Description	Work Item
Reports	The **Unassigned Cost Analysis Report** has been extended to support the reporting on either **ERP Codes** or **AMT Codes**. The modified report defaults to ERP (integration) codes to ensure continuity of results for existing users. If ERP Codes is selected, the report will work as it does now. If AMT Codes is selected, the component code, modifier code, task type, cost type, system and subsystem will be determined using the AMT Codes for the settlement. This will apply to the Analyse By options as well as the additional filter. 	27376
	Fixed an issue with label truncation in the **Labor Hrs Variance Report**.	27264

Functional Area	Description	Work Item
Reports	Fixed an issue with the following reports that could cause them to fail with an overflow error under specific conditions: • Changeout Analysis - Detailed. • Changeout Analysis. • Changeout Analysis - Detailed (LWM). • Parts Demand Analysis.	27301
	The **Component Status Report** no longer allows users to report of Branches they don't have access to.	27832
	The **Cost Analysis - "To Date" Report** no longer returns a **No Data** message, even though the data exists.	28220

Version 8.18

The following is a list of all changes and updates addressed in AMT Version 8.18.

Overview

The major changes between AMT Version 8.17 and 8.18 are as follows.

- New User Work Order Status field.
- Extended Labour Activity filtering.
- Bug fixes.

Enhancements

The following are the change requests and enhancements addressed in this release.

User Work Order Status

AMT has a new field in Work Orders, **User Work Oder Status**. User Work Order Status codes reflect the state of a work order from a user perspective; they should be used in conjunction with the AMT work order system status.

These codes are available to assist managing the status (or state) of a work order from an organisational perspective during the planning and scheduling lifecycle of a work order. For example, you may wish to know work is pending production release of the equipment, pending scope, awaiting parts or awaiting labour. Such states can be defined as a user status and applied to work orders, work orders can be searched using this status.

The User Work Order Status **cannot** be changed when the work order has a system status of:

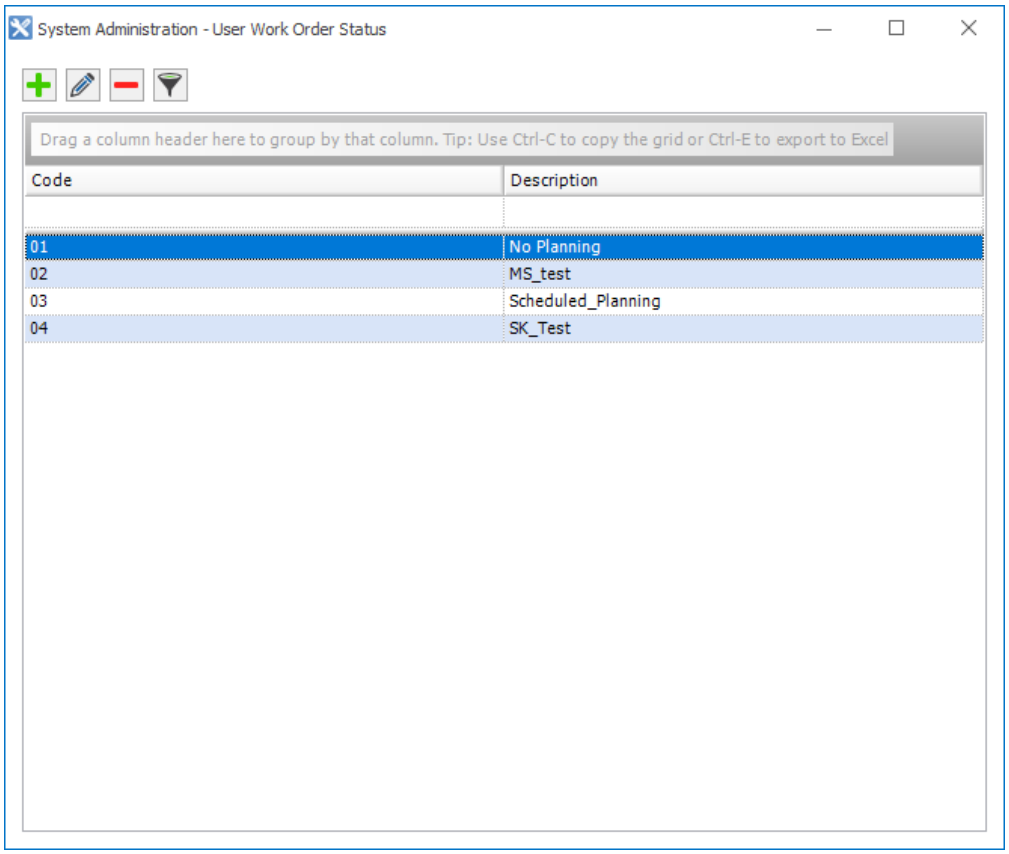

- In progress.
- Abandoned.
- Completed.

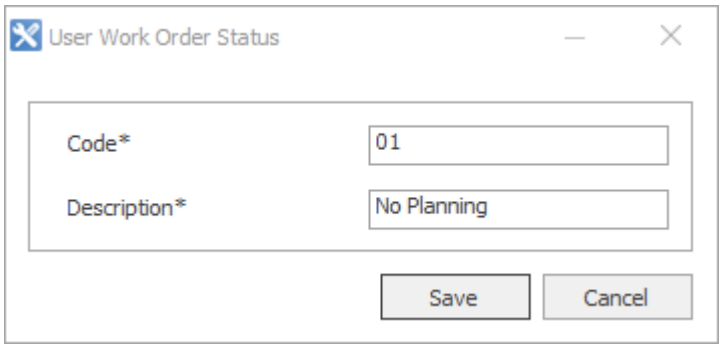

The following screens have the User Work Order Status field:

- **Daily Planning** > **Planning**.
  - Planning, Work Orders, Backlogs tabs.
- **Daily Operations** > **Equipment Status**.
  - Planning, Work Orders, Backlogs tabs.
- **Daily Operations** > **Daily Reports** > **Workorder Details**.

User Work Order Status Code Maintenance

An AMT Administrator maintains the available User Work Order Status codes using the new User Work Order Status system table editor (**System Administrator** > **System Tables** > **Maintenance** > **User Work Order Status**.

Feature Settings

The User Work Order Status feature is available from AMT 8.18 onwards. The following aspects of the feature can be controlled via configuration:

Audit Logging

A row has been created in AMT_LOG-CONFIG for User Defined Work Order Status. This row enables and disables audit logging for changes to the User Work Order Status.

- **LogEnabled** value = 0 turns off the audit log for changes to User Work Order Status.
- **LogEnabled** value = 1 turns off the audit log for changes to User Work Order Status.

- Set **LastModDate** to current date and time for users to pick up change on next login.

LogEnabled attribute should always be 1.

Status Change Comments

A row has been created in AMT_LOCAL_CONFIG_FIELD with field name User Defined Work Status.

This row controls behaviour for comments when changing User Defined Work Status.

- **AmtLogTypeId** value = 1 will not prompt the user for comments when changing status.
- **AmtLogTypeId** value = 2 not used (same behaviour as 1).
- **AmtLogTypeId** value = 3 will prompt the user for comment about why or when the status was changed.

To have users pick up any setting change on their next login, set the **LastModDate** attribute to current date and time for the **User Defined Workorder Status** entry in AMT_LOG_CONFIG.

Labour Activity Filtering

Labour Activity Resource Scheduling was added to AMT 8.8 in 2014 to slot in between, and compliment, Work Group and Employee Resource Scheduling.

There is no directly linked hierarchy between **Work Group** > **Labour Activity** > **Employee**. However, there is an inferred hierarchy with each sitting below the other.

It is very common to plan and schedule by Labour Activity level as there are so many trades, and multiples of these trades required per Work Order, such as Heavy Diesel Fitter, Auto Electrician, Boiler Maker, LV Electrician, HV Electrician, Fixed Plant Fitter, Light Vehicle Mechanic, Trades Assistant, Pump Fitter, Tyre Fitter, Crane Operator, Rigger/Dogman, Production Operator, Poly Welder, Air conditioning Mechanic, Scaffolder and so on.

To better support this mode, a Labour Activity Filter and Display Field are included on the following AMT screens:

- **Planning** > **Planning** tab.
- **Planning** > **Scheduling** tab.
- **Planning** > **Scheduling** - drag and drop work orders.

A single Work Order can have multiple Labour Activities. In this scenario, AMT will display Labour Activity Descriptions included with a vertical bar separator. For example, if Work Order 1 had Operations/Labour Activity of:

Op 10 = Fitter FP.

Op 20 = Metal Fabricator.

Op 30 = Trades Assistant.

The system will show them as:

Fitter FP | Metal Fabricator | Trades Assistant

Issues Resolved

The following is a list of all issues resolved.

Functional Area	Description	Work Item
Billing	AMT no longer allows a user to create overlapping billing periods. In this version a warning is displayed if an attempt is made to create overlapping billing periods.	24690
Budgeting	The **Budgeting Equipment Cost Analysis Report** no longer raises a error if the component description is too long.	26642
Equipment	The **Equipment Hierarchy** control now sorts all levels alphabetically.	26912
Planning	Fixed an issue, introduced in AMT 8.17, where the planning grid horizontal scroll bar was not available due to all displayed columns being auto-sized.	26864
Plant Hire	An error no longer occurs if the user modifies, and then refreshes, data on the **Plant Hire** or **Capital Details** forms.	26447
Usages	Improved the performance of the **Production Statistics Data Capture** form when filtering specific conditions.	24936
	The **Monthly Usages Profile** screen no longer accepts negative values in the **Show Decimals** field.	26418
Work Orders	Fixed a rounding issue that could cause the **Hours** value shown in the **Work Order Operations** to be different from the **Labour** tab.	26078
	The **Repair Description** now displays in the **Work Order Settlement Manager**.	26129
	The **Work Order Settlement Date** no longer shows a value of 01-Jan-10001 when AMT is configured to run in **ACW mode**.	26854
Settlements	The file lock error no longer occursin the 'classic' **Import Work Order** Summary web service if two requests are made to import summaries within the same second.	26753

Functional Area	Description	Work Item
Mobile	Changed the Date/Time control on the **Add/Edit Defects** screen (Estimated Labour Hours and Estimated Duration Hours) and the **Add/Edit Work Order** screen (Planned Duration and Actual Duration Hours) into separate hours and minutes fields. The hours field accepts values > 23.	26436
	An error no longer occurs when selecting a component from the **Customer** > **Component Forecast** view.	26622
Recalc	Fixed an issue where a datatype's maximum value could be exceeded, causing recalc to fail.	26870
Reports	The **Cyle Cost Summary @ Cost** Report now also displays under **Reporting & Analysis** > **Costs** > **Cost**.	26581
	The **Projection Summary** Report now shows data when launched via the **Equipment Edit Quick Links** control.	26530
	Fixed an issue in the **Component Status Report** where **Long-term Planning Life Used %** is no longer empty for tasks in supression groups.	25728

Version 8.17 U1

The following is a list of all changes and updates addressed in AMT Version 8.17 U1.

Overview

The major changes between AMT Version 8.17 and 8.17 U1 are as follows.

- Bug Fixes.

Issues Resolved

The following is a list of all issues resolved.

Functional Area	Description	Work Item
Windows Client	Resolved several instances where a Date/Time field did not permit the editing of the time.	27557
Equipment	Real assets are now sorted alphabetically in the equipment hierarchy view.	26914
Functional Location	Changing the number of levels to display in the **Functional Location Manager**, then closing and re-opening the Functional Location Manager now persists the new level value.	27248
Planning	Fixed several issues with the **Long Term Planning** > **Next Occurrence Import** feature that could cause the import to fail, or fail with confusing error messages.	27164
	The **Work Order** form is now easier to use as the grid columns no longer automatically re-size to fit the width of the form.	26867
	Applying certain filters in the **Long-Term Planning** form no longer results in an error.	26840
Plant Hire	Updating **Usage Profile** information from the **Plant Hire** tab no longer results in an error.	26514

Functional Area	Description	Work Item
Printing	Fixed an issue where selecting the **Print** option via the **Print Job** folder **Quick Link** would display a print preview, but then attempting to print to a physical printer would result in a No Data message.	27361
	EventScope (Simple) and **EventScope (Full)** reports no longer produce an error when attempting to print.	27438
Strategy Tasks	Exposed the **Modifier Code** on the Depreciation, Finance and Insurance Strategy Task forms.	27355
	The **Update Planning from Strategy** system task no longer creates strategy task work orders with a target date of the current date.	27133
Usages	Improved the performance of the **Daily Operations** > **Usages & Measurements** > **Production Statistics Data Capture** feature.	26529
	It is no longer possible to enter negative values in the **Monthly Usage Profile** form.	26418
Work Orders	Rounding no longer causes the same value to appear differently on the **Work Order Labour** and **Operations** tabs.	26527
	Repair Description values are now displayed in the **Work Order Settlement Manager**.	26617
	Changing the status of a Work Order to YTS no longer sets the **Scheduling** > **Start Date** to 30/07/2008.	27396
Work Orders (Integration)	Fixed an issue where processing **Work Order Summaries** via Integration could result in the following error being logged multiple times: *Amt.Data.PutFile* *System.IO.IOException: The process cannot access the file 'C:\Program Files (x86)\iSolutions\Amt\Archive\WebService - ImportWorkorderSummaryAll [Date].cml' because it is being used by another process.*	26829

Functional Area	Description	Work Item
Mobile	Opening a component from the **Component Forecast** view no longer results in an error.	26704
	Fixed an issue where the **Estimated Labour Hours** and **Estimated Duration Hours** on the **Add/Edit Defects** screen, and **Planned Duration** and **Actual Duration Hours** on the **Add/Edit Workorder** forms would not accept a time greater than 99 hours. In this version, the controls have been replaced by separate hours and Minutes fields.	26596
DLCC	Fixed an issue with a datatype that could cause the DLCC process to fail if the number of occurrences exceeded the maximum value permitted.	26907
Reports	The **Budget Forecast** report no long shows zero actual costs.	27385
	Fixed a label truncation issue in the **Labour Hours Variance** report.	27263
	Fixed an issue in the **Changeout Analysis - Detailed** report, **Parts Demand Analysis** report and **Rebuild Centre Forecast Workload** report, where an overflow error could occur where the underlying projected task ID was very large.	27302
	The **MARC PCV @ Cost** report is now rendered correctly.	27516
	Fixed an issue with **Quote Documentation** reports, where certain reports could hang depending on the case used when naming reports.	27226
	The **Long-term Planning Log** report no longer raises an error when executed.	26820
	The **Projection Summary** report no longer produces a No Data message when running the report from the **Equipment Editor Quick Link** option.	26538
	Fixed an issue in the **Component Status** report where the Life Used % column could be empty if the associated task was in a suppression group.	26571
	The **new Cycle Cost Summary @ Cost** report now displays correctly under the **Reporting & Analysis** > **Costs** > **Costs** area in the function hierercy.	26581
Reports	The **MARC PCV Chart @ Cost** report can now be run correctly.	26538

Version 8.17

The following is a list of all changes and updates addressed in AMT Version 8.17.

Overview

The major changes between AMT Version 8.16 U1 and 8.17 are as follows.

- New Capital Asset Depreciation Feature.
- Enhanced MTBF Report.
- Bug Fixes.

Enhancements

The following are the change requests and enhancements addressed in this release.

Depreciation

Work Item : 22444

The recognition of initial capital and associated depreciation is an integral part of understanding the lifecycle cost of assets. AMT 8.17 has been enhanced with a new **Capital Asset Depreciation** feature, including:

- User-defined financial periods.
- New Entry Distribution Codes.
- Support for straight line and usage-base depreciation.
- A new Depreciable Asset Manager and Editor.
    - Status changes.
    - Dispose assets.
    - Impair assets.
    - Revalue assets.
    - Transfer assets.

Comprehensive documentation for this feature is available from your RPM Global Account Manager.

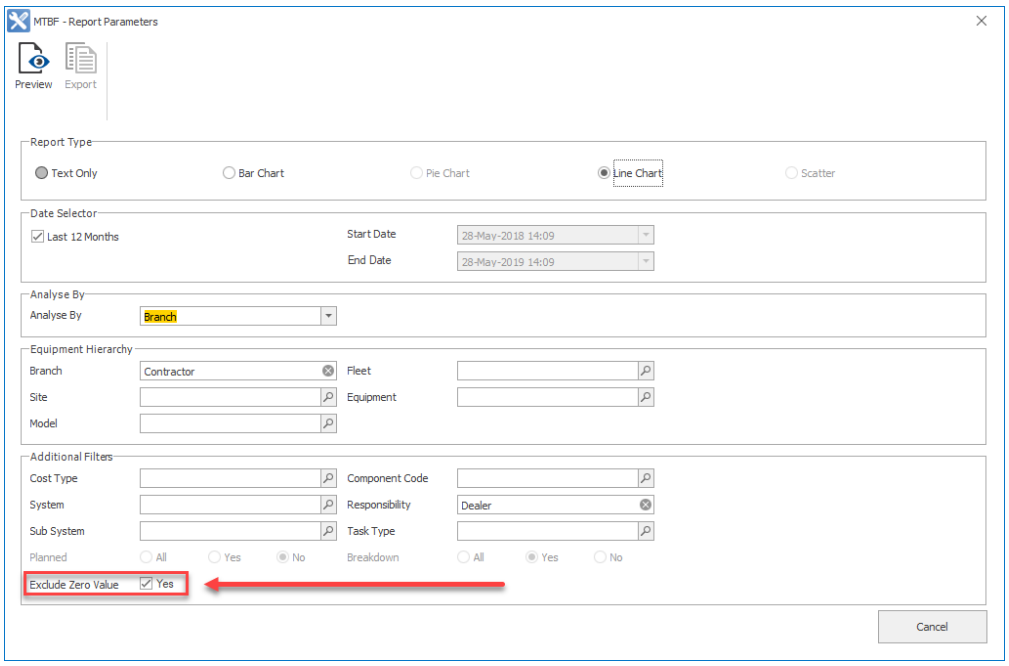

Notes:

1. **Feature ID 35** needs to be activated to make the Capital Asset Depreciation feature available.
2. User-defined financial periods must be created in AMT in order to use Capital Asset Depreciation.

Reports

Work Item : 15906

The MTBF report has been enhanced with a new option to exclude items with zero values. With this option selected, the report omits items with no data, reducing the visual clutter in the report, allowing you to focus on the items that matter.

Issues Resolved

The following is a list of all issues resolved.

Functional Area	Description	Work Item
Cubes	The **Dashboard cube** no longer reports the incorrect number of overdue strategy tasks.	
	The Cubes extract process no longer times out and fails.	24596
	There are no longer inconsistent entries in the Billing cubes **BilllingAmounts** and **ProjectBilling** values.	24085
	Duplicate comments no longer cause the **Shutdown Quotes** cube processing to fail.	16274

Functional Area	Description	Work Item
Client	The **My Favourites** function area no longer shows items in mixed languages if a translation is available, and the current user is configured to use English.	17477
Client	On the Sales Status form, the label **Part** has been updated to **Part Number**.	19945
	An error no longer occurs while uploading a document to the AMT library if the **Person Responsible** is not specified.	24499
	Where available, localised strings for the **Loading Data**, **Please Wait** and **Invalid Login** messages are used.	24696
Components	The following columns have been renamed in the **Component Changeout Grid** to better reflect the data they display. Default Rebuild Part Number = Next Part Number Required Default Rebuild Site = Next Rebuild Site Default Part Classification = Next Part Classification	20204
	The **Next Part Number Required** column (formerly captioned Default Rebuild Part Number) in the Component Changeout Grid now displays parts using the same parts formatting convention used elsewhere in AMT.	24860
Dashboard	Terminated equipment are no longer included in the **Overdue Tasks** dashboard.	12772
	Strategy Task - Overdue and **Strategy Task - Action Required** dashboard metrics now change when a new machine is selected.	23867
Downtime	The formatting of the PlannedDown and Planned Up fields no longer causes **Planned Downtime Import** (Deliverability) to fail.	23872
Equipment	In the Fleet Editor screen, decimal values are no longer rejected by the Tolerance field.	24457
	The list of equipment in the Equipment selector hierarchy are now sorted by Name and not Internal ID, so they are no longer look as though they are out of order.	25091
Events	On the **Planning** screen > **Events** tab, the **Expected Up** time now displays the correct value. In this release, Expected Up is calculated as **Actual Down + Planned Downtime**.	26150

Functional Area	Description	Work Item
Functional Location	A misleading error message is no longer displayed when attempting to run any Functional Location report before a newly created functional location is transferred to the Live Cube Database. In this scenario, the message Please select **FY YTD Month** is displayed.	26177
	Deleting a child Functional Location node no longer results in an error.	24485
	Fixed the following issues in the **Functional Location Manager**: 1. Tool tips are now displayed for all equipment. 2. The Assets column is blanked out when associated equipment is deleted. 3. The Red icon no longer disappears when the Asset cell is clicked. 4. The Strategy form now opens in response to a strategy being clicked. 5. Deleted items are displayed with strikethrough text.	24476
	This release improves the load performance of the **Functional Location** tree.	24425
	This release fixes several aesthetic issues with the **Functional Location Cost Analysis Report**. Also, deleted functional locations no longer display in the report.	12464
Parts	When a part is added in the **Parts Manager** without any details, the empty part can be deleted without causing an error.	25464
	Fixed an issue in **Supersede Parts** where only the first part from the source standard job would be applied to the target standard job.	23754
	It is no longer possible to supersede a part with a superseded part.	23769
	Fixed several aesthetic issues with the **Inventory Parts** dialog.	24219

Functional Area	Description	Work Item
Planning	On the **Work Order Editor** form, the **Other Resources** check box no longer clears when doing the following: Select the Other Resources option > Assign an Event Start Time in the planning window > Save the work order.	24261
	Refreshing no longer impacts the display of the **Overdue Strategy Task %** calculation on the Dashboard.	12629
	Improved the performance of **Long Term Planning** filtering.	24114
	Default 0 values now display on the Multi-Task % Cost Adjuster dialog.	24149
	The DLCC engine no longer uses the equipment End of Life data as TargetDate if the next occurrence date is outside the planning window. In this release, the next occurrence date is used as the next date.	24701
Plant Hire	Under specific circumstances, usage profiles are now updated by the **Auto-update utilisation** logic.	25428
	Improved the performance of the **Review/Edit Processed Hire Charges** filter function and the deletion of **Plant Hire Rates**.	25438

Functional Area	Description	Work Item
Printing	This release supresses the message indicating the number of documents to be printed when printing from the **Workorder** > **Print Job Folder** option. The message is only displayed when printing via the **Bulk Printing** function.	
	Errors no longer occur when printing a **PDF Portfolio**.	23992
	When constructing a **PDF Portfolio** document containing an unsupported file type, a message showing the names of all unsupported file types is not displayed. Supported file types are XPS, DOCX, JPG, PNG, XLSX, CSV, BMP, XLS, DOC, HTIML and PDF.	23621
	Added support for CSV, BMP, XLS, DOC, HTML files to the **PDF Portfolio** creation function.	23735
	When creating a PDF Portfolio, images larger than the selected page size are no longer cropped.	23583
	When creating a **PDF Portfolio** containing an Excel sheet or Word document from a computer where Excel or Word are not installed no longer creates an error. In this release, Excel and Word are treated as unsupported file types if the Excel or Word applications are not installed.	23615
Settings	Users with **View** permissions in **Long Term Planning** can no longer make changes via the Gantt Chart view.	23772
	Adding a new **Fleet** via the **Fleet Administration** view no longer results in an error.	24009
	When adding a task counter record in the **Task Counter System Table Editor**, then closing the editor without saving the record no longer creates an error.	24503
	In the **Group Editor System Table Editor** the Branch Code and WO Suffix fields are no longer erroneously displayed.	24748

Functional Area	Description	Work Item
Standard Jobs	Decimal values no longer revert to integer values on the **Standard Jobs Editor**.	25487
	You are no longer prompted to save changes when closing the **Standard Job Editor** when no changes had been made to the data.	23394
	Fixed a decimal formatting display issue to stop different values (due to rounding) displaying on different tabs of the **Standard Jobs Editor** for the same value.	14452
Strategy Tasks	An error no longer occurs in the **Multi-Task Editor** while attempting to attach documents to strategy tasks if one of the documents contain unsupported encoding scheme.	25609
	Fixed an issue where the total hours of a work order would not be calculated correctly if AMT was configured to allow up for four planning work orders, that is, MaxPlanningWorkOrders = 4).	26008
	The **Multi-Strategy Task Editor** no longer allows changes to component code, modifier code, task type and task counter of unscheduled tasks.	26067
	The recalculation system task no longer fails if multiple unscheduled tasks for the same subsystem existed.	26068
	On the **Next Occurrence Export** form, the **Last Occ Strategy Usage** has been changed to **New Strategy Usage**.	22490
	You can now enter decimal values on the **Multi-Task % Cost Adjuster** form.	24248
	On the **Edit Next Due** form the **Last Performed** and **Scheduled Date** fields are no longer visible if there is no component history.	25334
	The **Strategy Task description** can no longer be removed while editing strategy task frequencies on the **Equipment Task Editor** tab or the **Editable Strategy Task** form.	25300
	Fixed an issue in the **Strategy Task Analyser** so that running the **Average Work Order Costs** report no longer results in an error.	25299
Timesheets	The **Work Order description** displayed in the **Timesheets** is now in the same format as displayed in the original work order.	24276

Functional Area	Description	Work Item
Usages	Fixed a branch filtering issue in the **Record Actual Usages** form that was resulting in all options being available, not just those matching the given filter.	22517
Workflow	An error no longer occurs when attempting to delete an item from the **Workorder Authorisation** screen after filtering by site.	24379
	Added support for a Component Serial Number lookup control to the **Create New Reman Process Workflow**.	24735
Work Orders	Copying **Strategy Tasks** with associated Electronic Workscopes now copies the Workscopes to the target Strategy Tasks.	24694
	Renamed the existing **Primary Part Number** column to **Part Number Used** in the **Workorder Settlement Manager**. Renamed the existing **Part** column to **Part Number** in the **Sales Status** form.	24861
	The **Refresh** button has been removed from the **Add Workorder Settlement** screen as clicking it was causing duplicates.	24940
	Changes to the order on the **Work Order Settlement Code Translation Rule Manager** form now persist when there are changes to the order.	24257
	Fixed a permissions issue in **the Work Order Settlement Code Translation Rule Manager** so that users with View or None permissions are now able to edit codes.	24258
	The **Skip Workorder** function no longer re-schedules the linked strategy task if AMT is in **Auto-Create Workorder Settlement** mode.	24282
	You can now drag and drop parts from the **Add Parts (Drag & Drop)** dialog into a Workorder.	24171
	The **Job Status Audit log** now includes creation events.	23751
	The **Workorders** > **Components** > **Primary Part Number** search facility now works correctly.	25632
	Specific filters no longer result in an error from the daily **Planning** > **Planning** view	24975

Functional Area	Description	Work Item
Integration	AMT no longer allows the importation of work order settlements containing invalid currencies.	24888
	Importing Projected Tasks no longer produces an error if the Work Group length is more than 10 characters. (You can import Projected Tasks with a Work Group length of up to 50 characters).	23811
	AMT SAP Connector no longer raises errors due to a missing function.	24146
	Any errors detected while importing PartType are no longer being reported as being at line 1 in the import file.	24419
	Errors detected during the **Supersede Import** process are now being logged.	25525
	Importing overhead costs with no cost centre no longer raises an error.	24025
	Clicking the Create PO button from a work order where the work order does not contain any parts or misc now displays a message, and does not cause an error.	25531
Mobile	An error no longer occurs when adding photos to inspections while the device is in portrait mode. (Attachments could be added in landscape mode without error).	25558
	The multi-select menu mobile filter control no longer returns multiple items when only one was expected.	25656
	Completing a work order no longer causes the work order to become unlinked from the event in AMT Client.	25523
	You can now open image attachments added to inspections in Mobile on a desktop computer.	25090
	Clicking the Mobile **Home** icon no longer displays the Offline options page (iPad and Desktop only).	25040
	Assets with no utilisation are no visible in Mobile.	25184
	Attempts to perform certain inspection no longer display the following error: **TypeError: Cannot read property LabourActivityId of undefined.**	25014

Functional Area	Description	Work Item
Mobile	This release resolves the following two issues related to **Work Order Repair** Instructions: 1. Saving a defect would duplicate the Repair Instruction into the Repair Description field, now these two fields are saved depending on which value is updated. 2. AMT Mobile now shows Operation Instruction as a non-editable field and Repair Description as an editable field on the work order view.	21289
	When entering an actual usage that is less than the previous usage in offline mode, an error message is now displayed during the synchronisation process.	23674
	The **Logout** function now works correctly on all devices.	23680
	Inspections configured to use the **Inspection wizard** now display colour coding to show which questions have been answered.	23715
	Work orders with the first operation deleted now show in offline mode.	23525
	Users are now asked whether they wish to participate in the mobile application usage analytics program.	24206
	Translations are now there for all labels in the **Quoter** function.	24244
	Apple devices running **iOS 10.3.3** no longer freeze when attempting to log in.	24268
	1. Added a visible delete button on the **Add/Edit Timesheet** screen (iPad only). 2. Added scroll functionality for the **Timesheet** grid (iPad only).	24408
	Added a **Home** button.	24361
	Added **Actual Duration** to the work order view.	24362
Mobile	The **Statutory Compliance** view **Back** button now operates correctly.	24363
	The hint text in the Employee Login screen is now correct.	24392

Functional Area	Description	Work Item
Recalc	Invalid hours no longer cause the recalc process to fail.	24352
	Moving backlogs that are linked to notifications out of the planning window no longer causes recalc to fail.	23723
	Changing an equipment's utilisation to advanced, then editing a usage step, no longer results in an error.	24052
	Implemented a business rule stating Centreline equipment cannot be terminated by date.	24053
	Recalc and Replanning no longer become unresponsive immediately after the **IC Extract** process had run.	23656
	Deleting an accrued settlement no longer causes recalc to fail.	24498
	There is no longer a grammatical error on the Recalculation Manager recalc request message dialog.	25128

Functional Area	Description	Work Item
Reports	Improved the performance of the **Parts Usage Forecast Report**.	23677
	Increased the column widths on the **Shift Downtime Log Report**.	22761
	Resolved several alignment issues in the **Parts Usage Report**.	23082
	In the **Cost per UOM Report**, the X-axis is now reset to 0 for each analysis item.	20942
	In the **Backlog Listing Report**, the age shown in the report now reflects the value in the work orders.	15444
	Fixed a rounding issue in the start time shown on the **Workorder Print Job** Folder.	12737
	Launching the **Average Workorder Costs Report** from the Strategy Task Analyser no longer raises an error.	25623
	Selecting multiple fleets or equipment in the **Hours to PM Report** no longer raises errors.	26260
	Fixed several layout issues in the **Equipment Evaluation - Summary Analysis Report**.	14284
	There is no longer an error in the Projection Summary Report if a component description exceeds 109 characters.	24293
	Fixed an issue in the Product Incident Listing Report where a certain data condition could cause an error while running the report.	24471
Software Analytics	The Software Analytics screen is no longer displayed when analytics is disabled at the system level.	24372
	Software Analytics now reports the user of the bulk printing feature.	24218
	Users can no longer dismiss the Software Analytics opt in/opt out dialog without making a choice.	24028
	Fixed several minor layout issues on the Software Analytics options screen.	23875
Web	In Parts Suppression, errors no longer occur while superseding parts without associated pricing information.	24918

Version 8.16 U2

The following is a list of all changes and updates addressed in AMT Version 8.16 U2.

Overview

The major changes between AMT Version 8.16 U1 and 8.16 U2 are as follows.

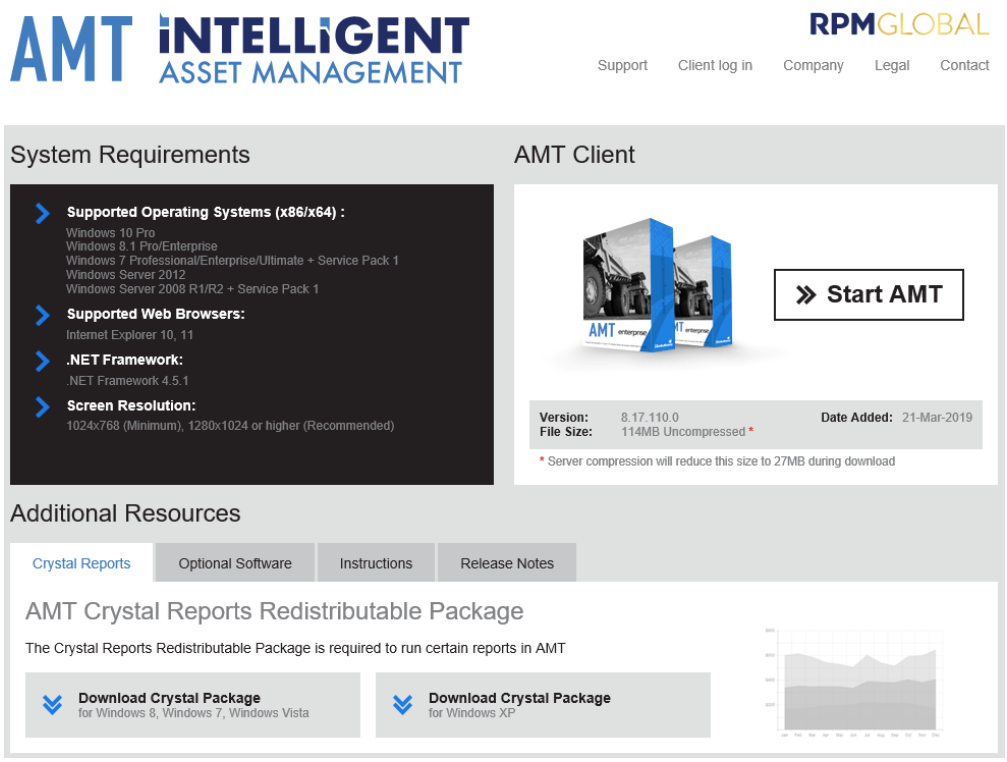

- New AMT branding.
- New AMT Mobile theme.
- AMT Mobile home button.
- Bug Fixes.

Enhancements

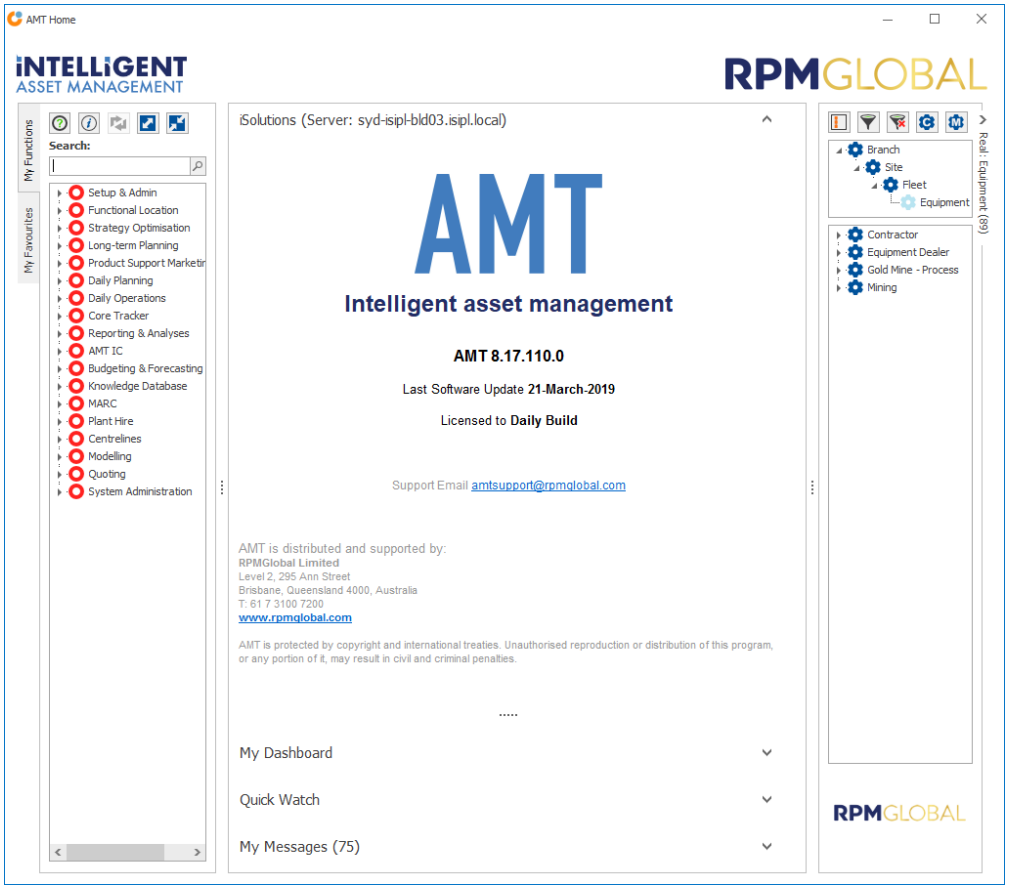

The following are the change requests and enhancements addressed in this release.

Client

New AMT branding has been applied to the **ClickOnce launch page** and the **AMT Client home screen**.

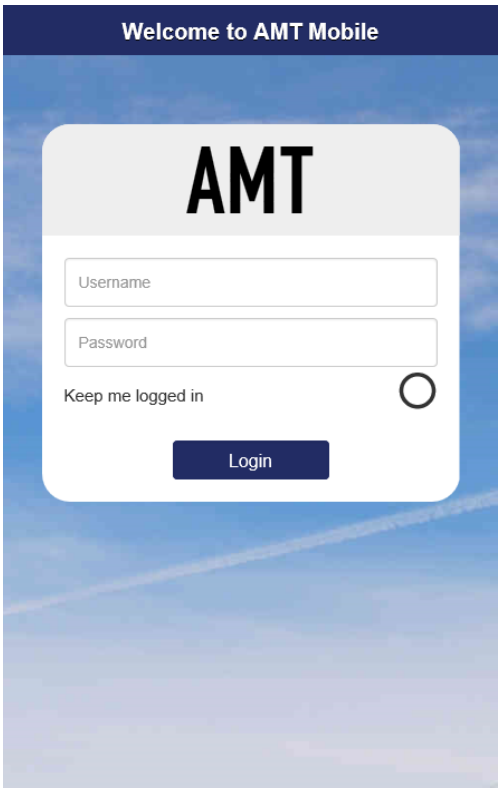

AMT Home page

AMT Mobile

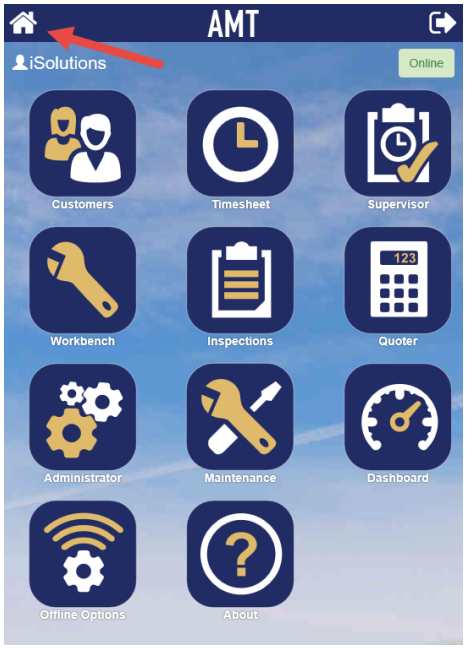

A **new theme** has been applied to AMT Mobile. The theme follows the new AMT branding, and is designed to be easier to read on smaller form factor devices.

Home button

A **home** button has been added to AMT Mobile when run on a small form factor device. The home button takes you back to the home page quickly from anywhere in the application.

Issues Resolved

The following is a list of all issues resolved.

Functional Area	Description	Work Item
AMT Mobile	Users no longer receive the error message **TypeError: Cannot read property "labourActivityId"** while performing an inspection in offline mode.	25088
	Assets with **no utilisation** (only date-based scheduling and reporting), as well as **Simple** and **Advanced** Utilisation are available.	25187
AMT Client	This release fixes an issue where some attachments, such as those accessible from **Workorders** > **Feedback** > **Attached**, could not be opened by the program associated with the attachment's file type. This issue was most evident to AMT Mobile users who attached photos to inspections, and then attempted to view those photos via the AMT client.	25314
Components	This release fixes an issue where the date value 01-Jan-0001 was displayed on the **Edit Next Due** > **Component Details** tab (Last Performed Date and Last Scheduled Data) if the component had no history. In this release, if a component has no history, the **Last Performed Date** and **Last Scheduled Date** fields are blank.	

Version 8.16 U1

The following is a list of all changes and updates addressed in AMT Version 8.16 U1.

Overview

The major changes between AMT Version 8.16 and 8.16 U1 are as follows.

- Usage Analytics.
- Support for CSV, BMP, DOC, XLS and HTML within PDF files was added to the PDF Portfolio feature.

Enhancements

The following are the change requests and enhancements addressed in this release.

Software Analytics

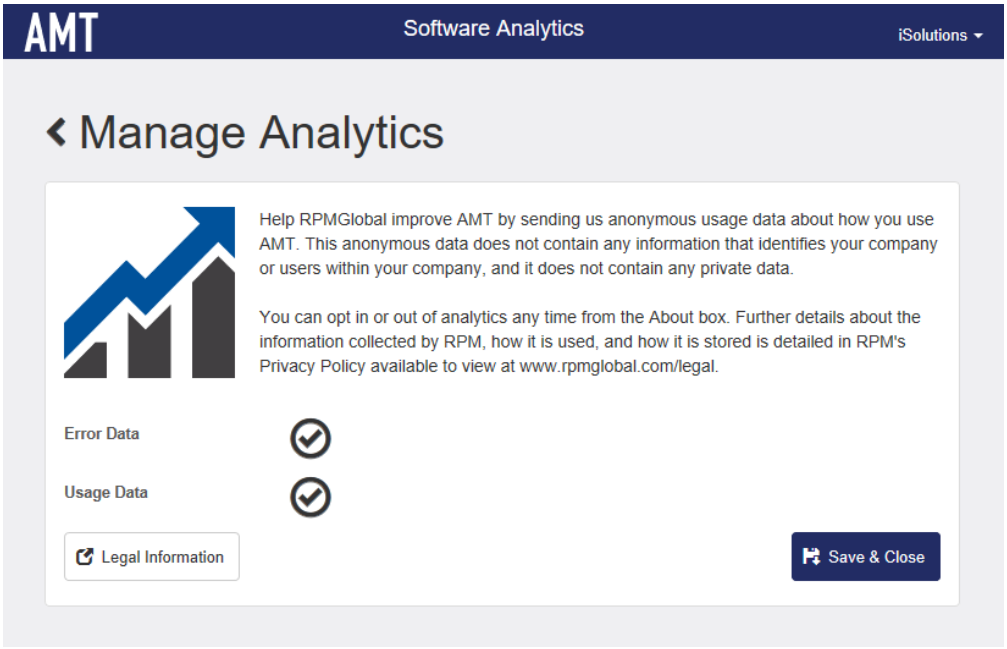

This release includes a new Software Analytics feature that optionally collects anonymous data from AMT. RPMGlobal uses this data to better understand how users interact with AMT.

Data collected does not include any information that identifies you or your company. It does not include any private data.

You can opt-in or opt-out of analytics from the AMT About box.

Assuming Software Analytics is enabled at the server level (see below), the first time a user logs into AMT 8.16 U1 they are asked if they wish to send anonymous usage data to RPMGlobal. Data collected is categorised by Error Data and Usage Data.

AMT Mobile Software analytics screen

Enable and disable Software Analytics

Software Analytics can be globally enabled or disabled. When disabled, no date is collected from any user, and the opt-in and opt-out dialogs are never shown. When enabled, the opt-in dialogs are shown for the first time AMT is started. Each user is able to choose to participate or not participate in the collection of user data.

Please advise your AMT Consultant if you want, or do not want, to activate this feature when organising your AMT 8.16 U1 installation.

Users can return to the **About** box at any time to change their opt-in or opt-out settings.

PDF Portfolio

The PDF Portfolio feature in AMT 8.16 has been extended to support the following additional file types:

- CSV.
- BMP.
- DOC.
- XLS.
- HTML.

These file types can now be included in a PDF Portfolio document.

Issues Resolved

The following is a list of all issues resolved.

Functional Area	Description	Work Item
PDF Portfolio	Fixed an issue where images embedded in a PDF Portfolio may be too small to view easily. Embedded images are now scaled up to fill the available space on the page.	23583
PDF Portfolio	A warning now displays indicating that unsupported file types are associated with the document to be converted into a PDF Portfolio and can not be included.	23621
IC Database	The performance of the IC data loading process has been improved. In previous versions, poor performance could impact other areas of AMT, including the recalculation engine.	23832
SAP Connector	The **SAP Connector Library** is no longer missing two functions available in earlier releases.	24250
Mobile	Progress colours for inspections are now displayed when AMT Mobile is run on a smart phone.	23715
Mobile	This release fixes an issue in **iOS Safari 10.3.3** that could cause users to not be able to log into AMT Mobile.	24268
Dashboard	Values for Strategy Task - Overdue and StrategyTask - Action Required now change when a new machine is selected. This release also displays related work orders for overdue strategy tasks when right-clicking them in the Dashboard.	23706
Recalc	Usage values are no longer incorrectly flagged as invalid in some circumstances.	23472
Work orders	It is now possible to add parts to a work order using drag and drop on the **Work Order Editor** form.	24151
Strategy Tasks	The **Save** button now works on the **Strategy Task Editor** form.	23895
Long Term Planning	The performance of the **Long Term Planning** filtering function has improved (some filter combinations would take minutes to run, and sometimes time out).	24099

Functional Area	Description	Work Item
Planning	The **Update Planning from Strategy** system task no longer fails when backlogs link to notifications moved out of the planning window.	23682
Planning	The **Skip Work Order** option now re-schedules the linked strategy task if AMT is in the auto-create work order settlement mode.	24282
Work orders	The behaviour of the **Dealer Customer Financial** mode setting has changed so that, when active, the **Workorder Settlement** tab is now visible (in previous versions the tab was hidden).	23239
Fleet Administration	An error no longer occurs when trying to add a new fleet via the **Fleet Administration** form.	24009
Strategy Tasks	The Copy Strategy Tasks function now copies EWS references.	24692
Workorder Settlement Manager	Part terminology has been changed on the **Workorder Settlement Manager** to better communicate the meaning of the following fields: 1. In the grid, the **Primary Part Number** caption has been changed to **Part Number Used**. 2. In the Display Fields selector, **Primary Part Number** has been changed to **Part Number Used**.	24861
Component Changeout Grid	Part terminology has been changed on the Component Changeout Grid to better communicate the meaning of the following fields in the grid: 1. The **Default Rebuild Part Number** caption has been changed to **Next Part Number Required**. 2. The **Default Rebuild Site** caption has been changed to **Next Rebuild Site**. 3. The **Default Part Classification** caption has been changed to **Next Part Classification**. 4. The data shown in the **Next Part Number Required** column has been changed from a concatenation of the Part and Part Description fields to just **Part**.	24860
Job Status Audit Log	The **Job Status Audit Log** now includes creation events.	23752

Functional Area	Description	Work Item
Long Term Planning	Filtering by Branch on the Long-term Planning Log report now works correctly.	22690
Record Actual Usages	Filtering by Branch on the Record Actual Usages form now works correctly.	22517
Next Occurrence Export	In the **Next Occurrence Export** report, the **Last Occ Strategy Usage** column is now correctly labelled as **New Strategy Usage**.	22490

Version 8.16

The following is a list of all changes and updates addressed in AMT Version 8.16.

Overview

The major changes between AMT Version 8.15 and 8.16 are as follows.

- Bulk Printing enhancements.
- Scheduled Inspections support in AMT Mobile.
- Improved Work Order Editor.
- Support for Labour Hours in the Budgeting and Forecasting Module.
- Support for SQL Server 2016.
- F1 Help.
- About Box.

Enhancements

The following are the change requests and enhancements addressed in this release.

Database: Work Item 21636

This release adds official support for SQL Server 2016.

Bulk Printing: Work Item 22186

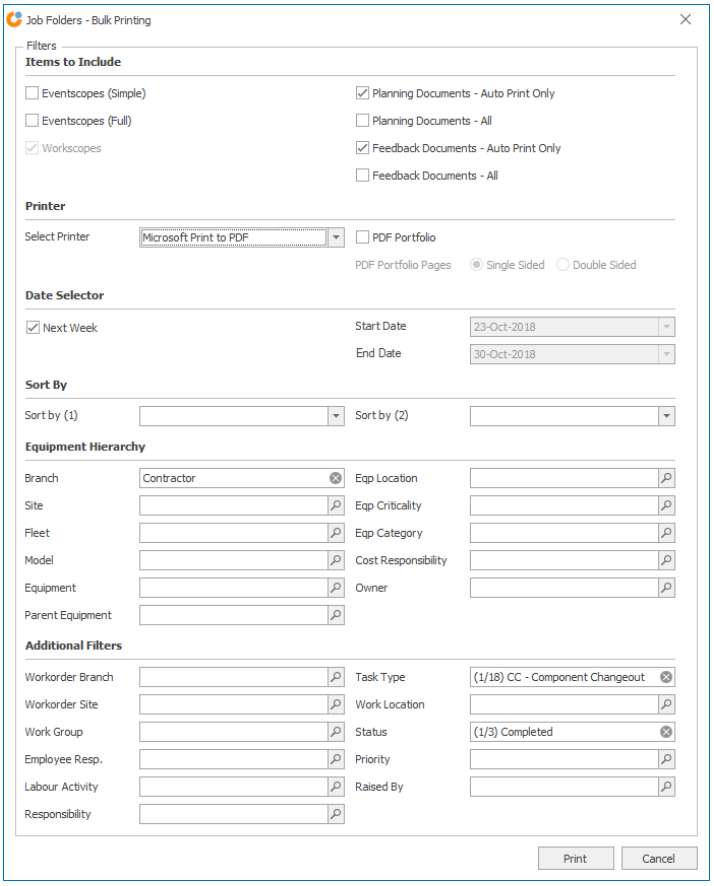

The **Job Folders** > **Bulk Printing** feature has been enhanced to include support for printing to a PDF Portfolio document. A PDF Portfolio contains multiple files assembled into an integrated PDF document.

The benefits of being able to create a PDF Portfolio document from the **Job Folders** > **Bulk Printing** dialog include:

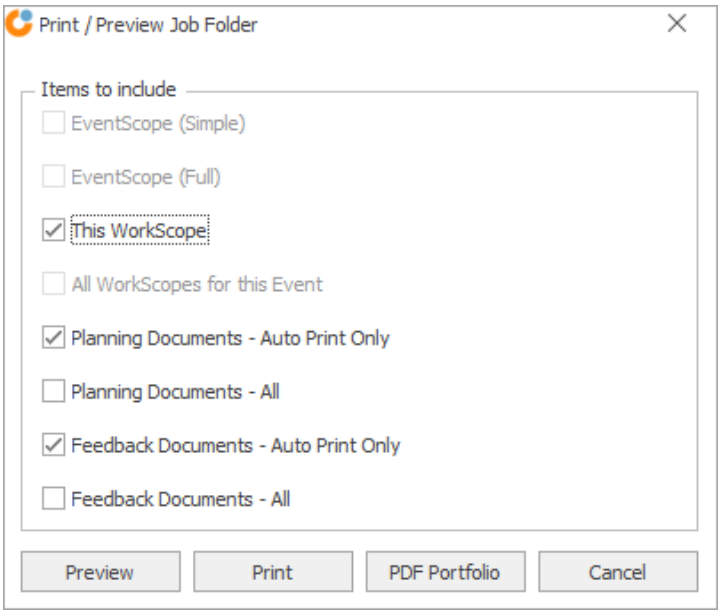

- There is no need to have the application installed that creates the document.
- All documents contained in a PDF Portfolio document can be printed to a physical printer as a single print job. This mean all documents will be printed sequentially with no possibility of other user's documents becoming interspersed with your bulk printed documents. This eliminates the time-consuming task of searching for and removing sheets of paper that are not part of your print task.
- All documents contained in a PDF Portfolio can also be printed to a physical printer as discrete print jobs. If your printer supports stapling you can instruct the printer to staple each individual document.
  For more information about PDF Portfolio documents, see:
  https://helpx.adobe.com/acrobat/using/overview-pdf-portfolios.html

To support the creation of PDF Portfolios, the **Job Folders** > **Bulk Printing** dialog has been extended to include **PDF Portfolio** as an option in the **Printer** section. You also have the option of creating a Single-Sided or Double-Sided PDF Portfolio document.

- A **Single-Sided** document creates individual PDF documents with the exact number of pages as in the source document.
- A **Double-Sided** document creates individual PDF documents that have an even number of pages. It does this by inserting a blank page at the end of each child document (if necessary). This ensures that printing the entire PDF Portfolio as a single print job, with the printer configured to print double-sided, will start each new document on the 'face' side of the page.

The **Workorder Editor** > **Print Job Folder** Quick Links options have as also been enhanced to support the creation of PDF Portfolio documents.

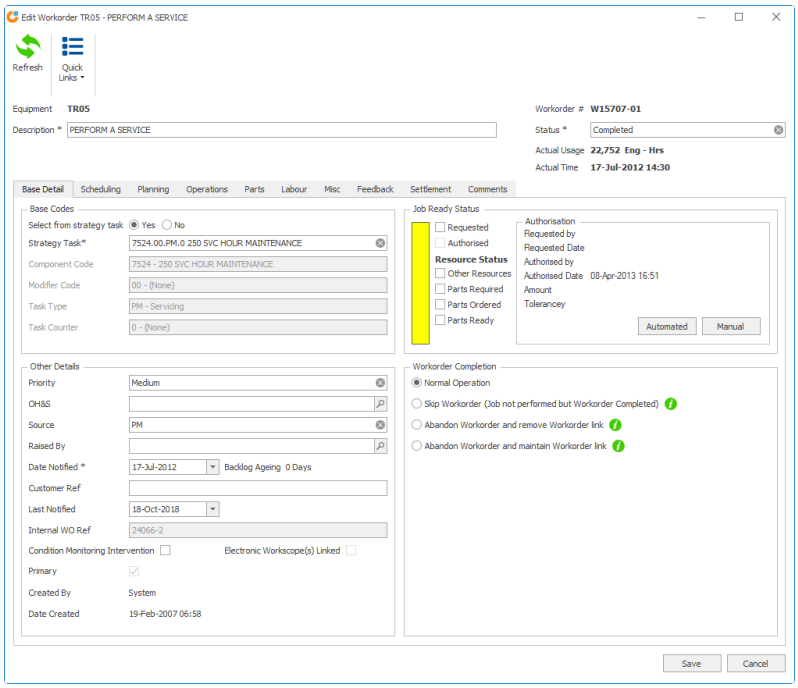

In this release, the types of attachments that can be included in a PDF Portfolio are limited to:

- DOCX
- XLSX
- PDF
- XPS
- JPG
- PNG

Work orders: Work item 22523

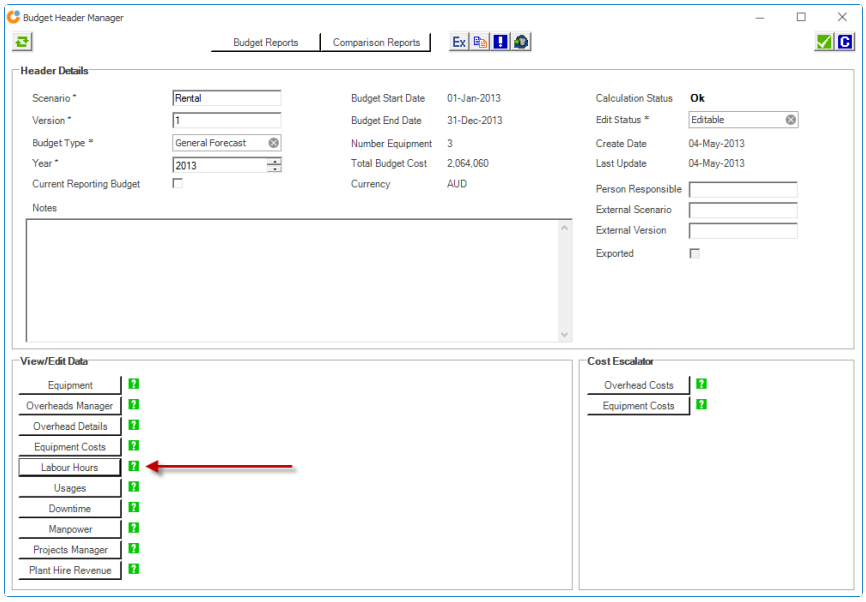

The Edit Workorder form has been re-factored to comply with the new AMT UI standard first introduced in AMT 8.14. Core functionality remains unchanged.

Note the **Save** and **Cancel** buttons have been moved to the bottom right corner of the dialog as per Windows standards:

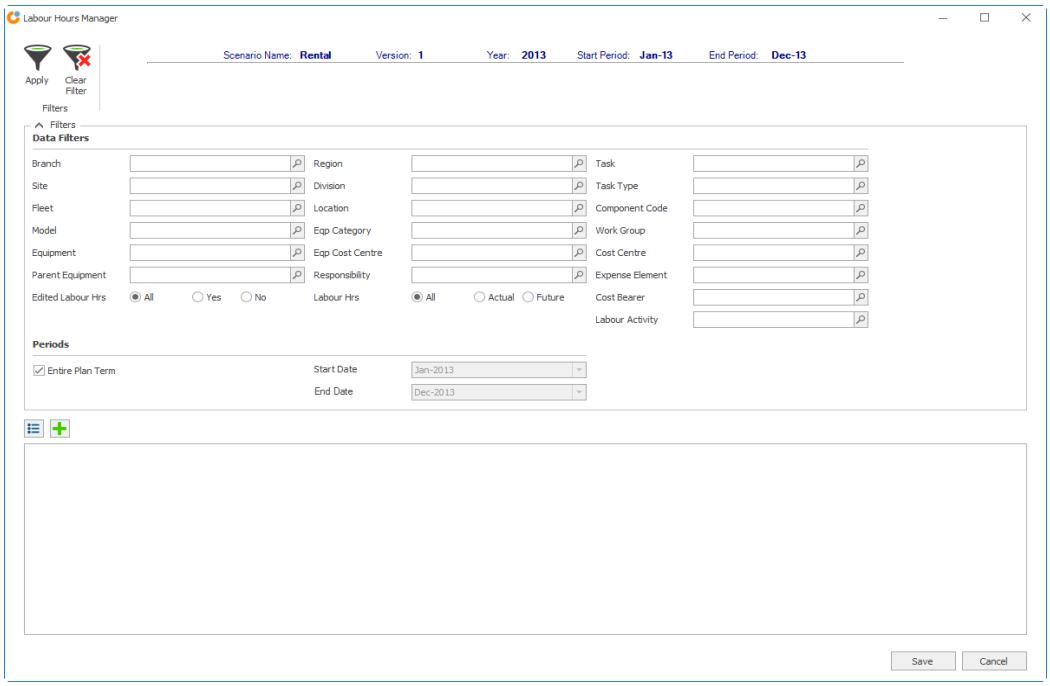

Budgeting: Work Item 22008

The **Budget Header Manager** has been enhanced to support the definition of **Labour Hours**.

Clicking the **Labour Hours** button displays the **Labour Hours Manager**. Use the **Labour Hours Manager** to add and edit labour costs for the given budget period.

AMT Mobile: Work Item 22447

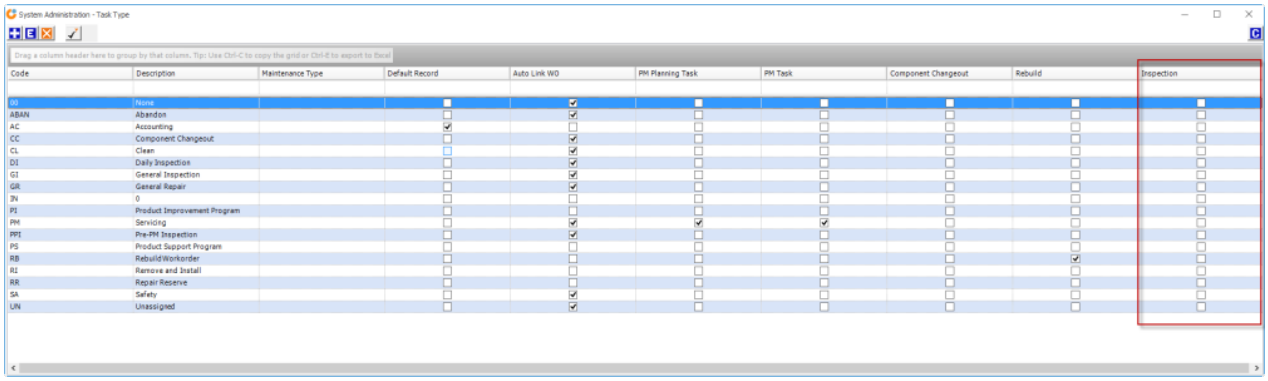

Support for Scheduled Inspections

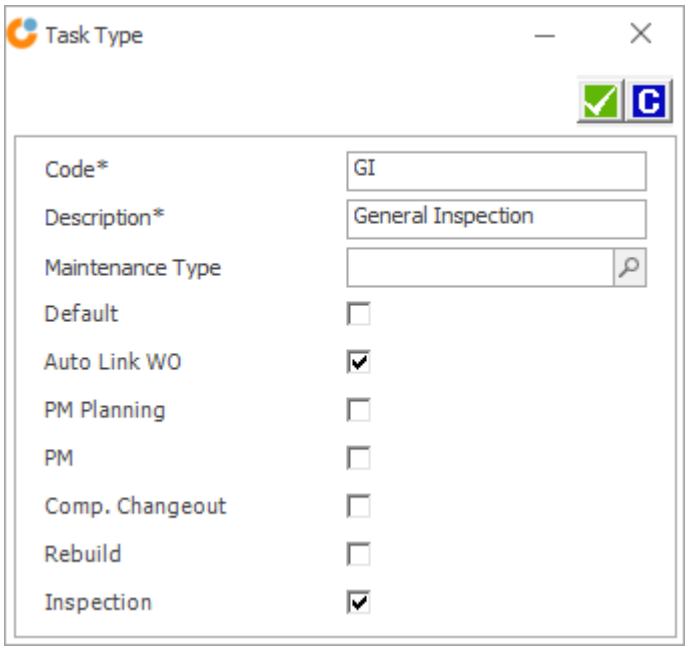

In previous versions, AMT Mobile only allowed ad-hoc inspections. However, most maintenance strategies for equipment involve some degree of inspection tasks. For AMT Mobile to be a more effective inspection application, inspections defined by Reliability Engineers in Strategy Tasks need to be visible to AMT Mobile users.

To support this, AMT has been enhanced to support the generation of **Scheduled Inspection Workorders**, and AMT Mobile has been enhanced to view, execute and complete **Scheduled Inspection Workorders** in the field.

Changes to AMT

The **Task Type** system administration screen has been enhanced through the addition of an **Inspection** column. This allows you to indicate if the task type can be used for an inspection.

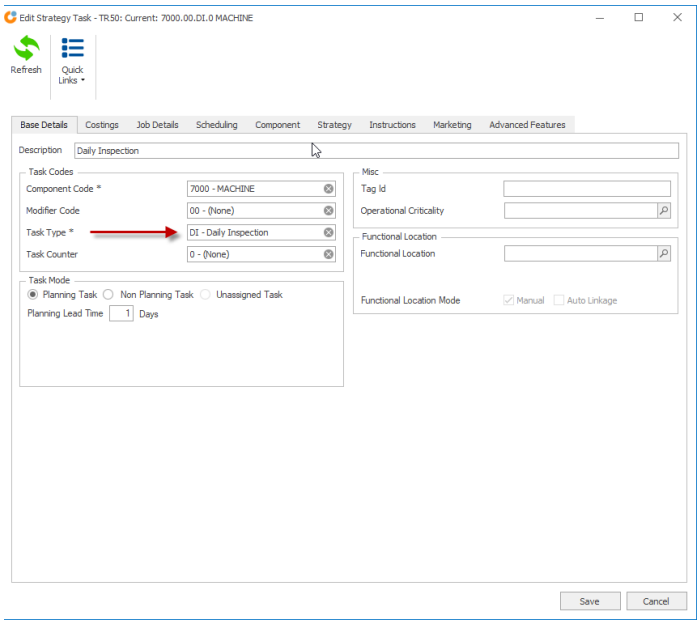

Inspection Strategy Tasks

The system task that converts Strategy Tasks to work orders has been enhanced to create inspection work orders. For a Strategy Task to be an inspection task it needs:

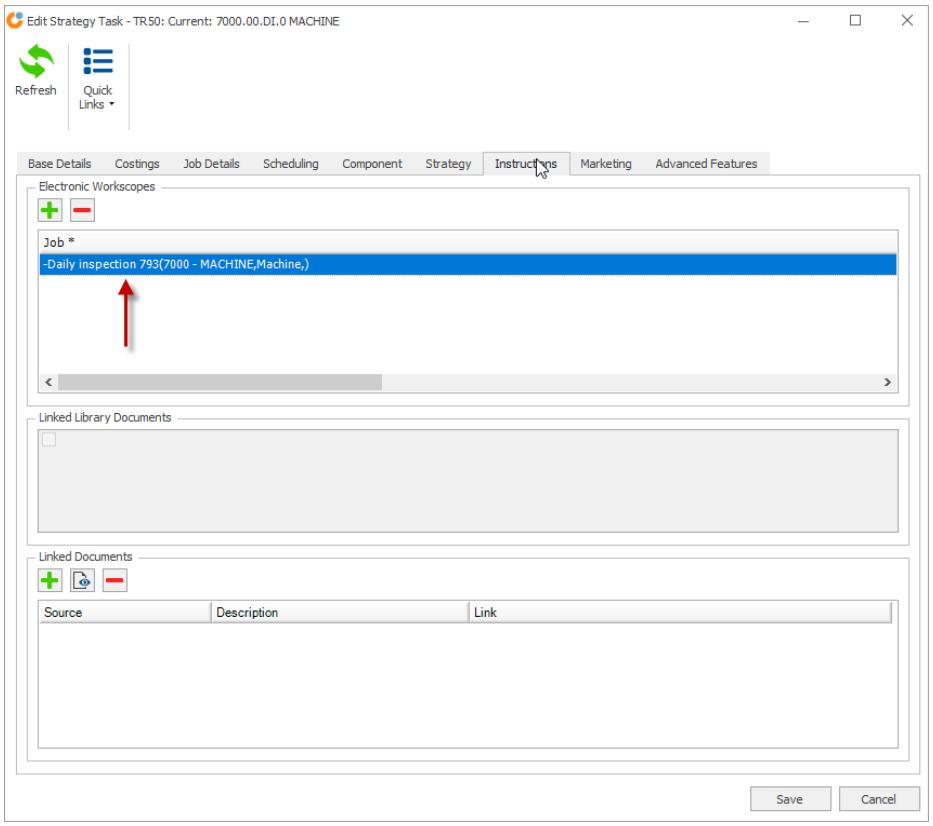

- a task type marked as an Inspection Type (see above).
- one operation and one Electronic Work Scope.

At this point, only one operation with one Electronic Work Scope is supported on the resulting work order for scheduled inspections on mobile.

In the example below, on the **Base Details** tab, note the **Task Type** is **DI-Daily Inspection**.

On the **Instructions** tab note that one, (and only one), Electronic Workscope exists.

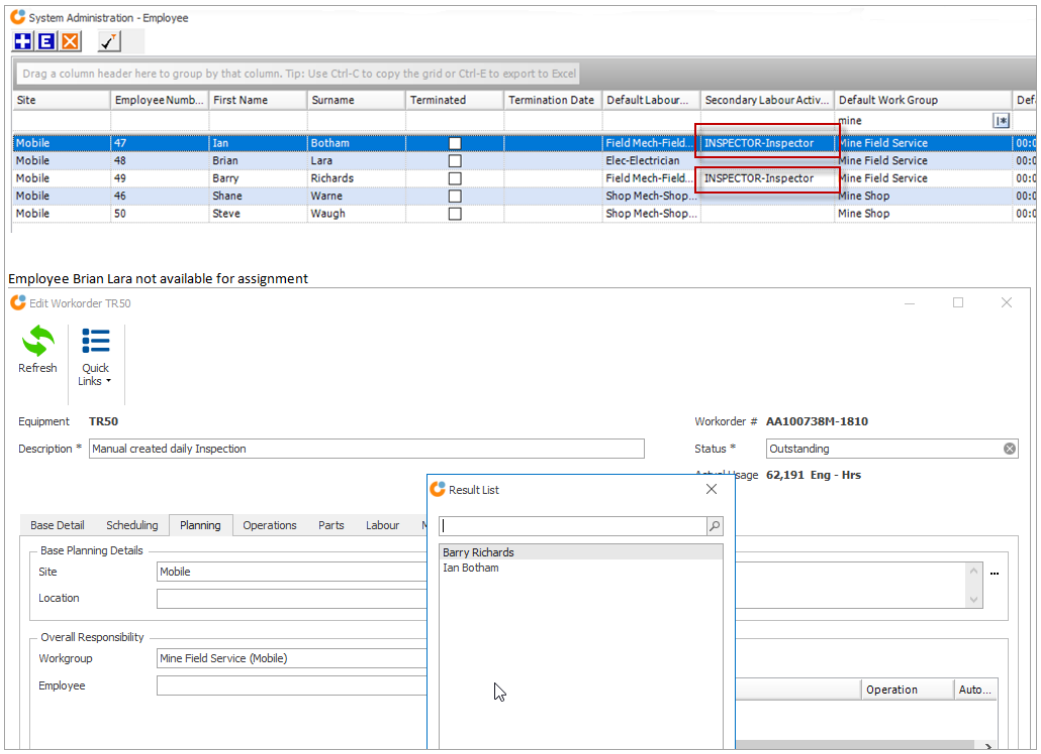

An ordinary work order is created if these conditions are not met.

Inspection Standard Jobs

Like Strategy Tasks, Standard Jobs can drive the creation of an inspection work order. Standard Jobs require a task type configured for inspections, and they require one operation linked to one Electronic Work Scope.

Assigning The Responsible Employee

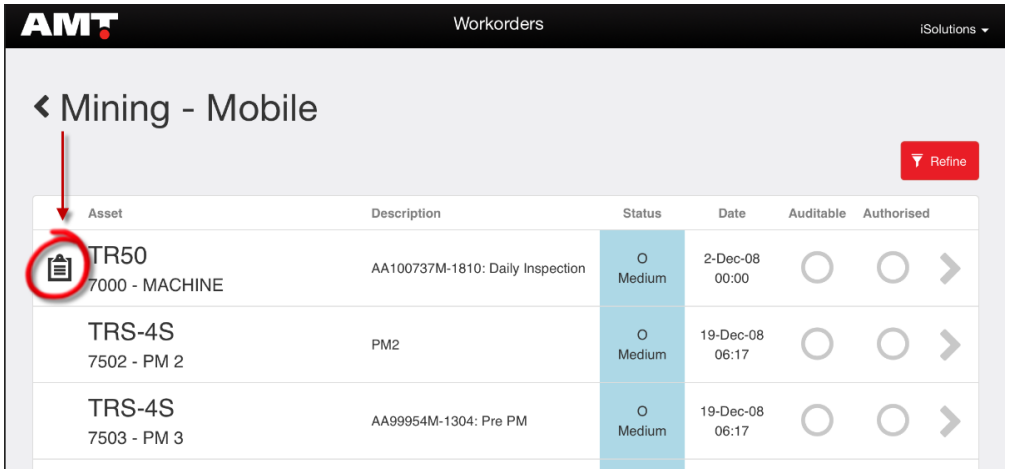

While assigning the responsible employee to an inspection work order, only those employees with a primary or secondary labour activity associated with the inspection work order are available to be selected.

Changes to AMT Mobile

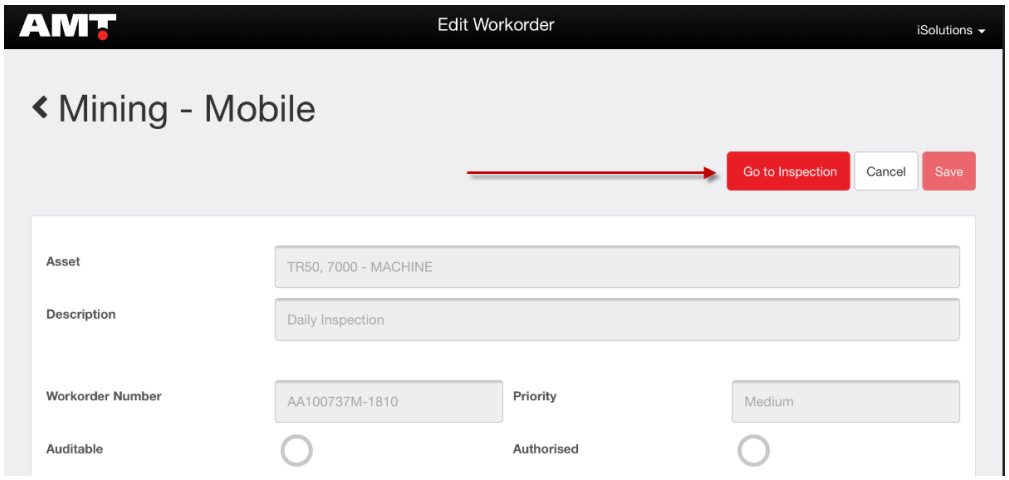

Inspection clipboard Icon

Work orders have an **Inspection clipboard icon** to indicate they are inspections.

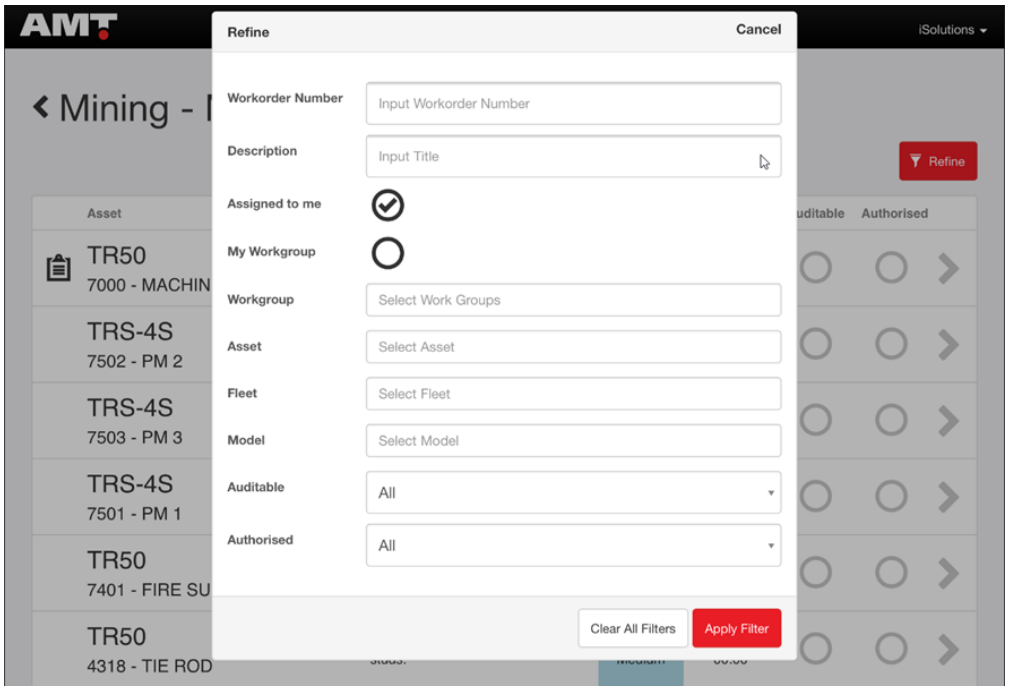

Edit Workorder View

The **Edit Workorder** view provides the option to perform the inspection via the new **Go to Inspection** button.

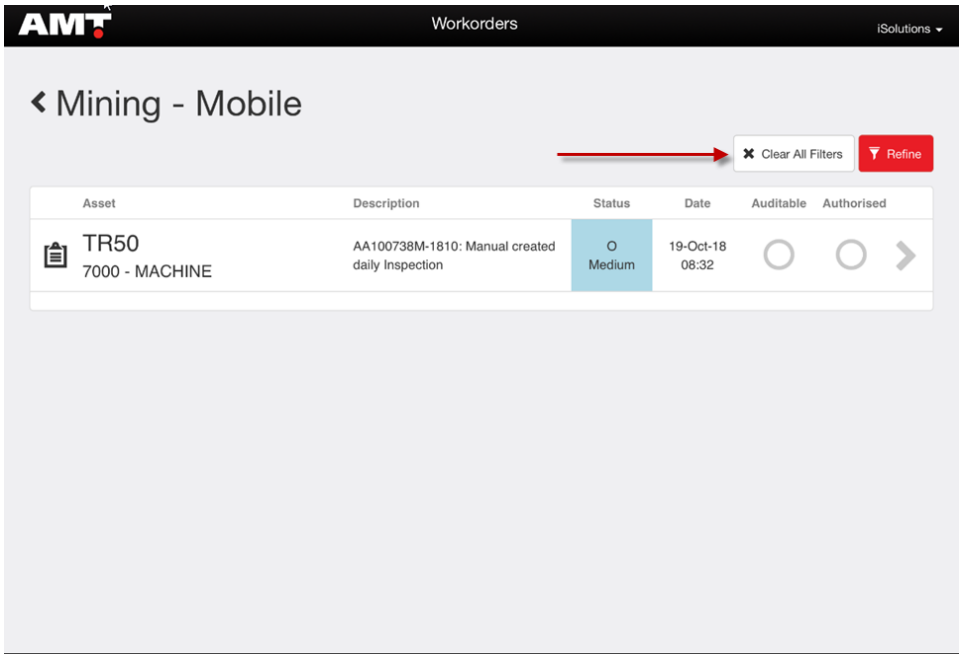

Workorder List View

The **Workorder list view** has new filter options for work **Assigned to me** and work for **My Workgroup**.

This screen also shows the changes made for visibility of the work list being filtered. It is easy to clear the filters to see all work orders, or to edit or refine the list if you can not see what you are looking for. Previously it was hard to tell whether a filter had been applied or not.

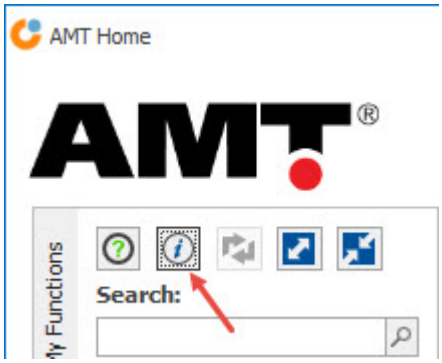

Filters are now also retained for the current session.

Client: work Item 26456

An **About Box** has been added to AMT. The About Box displays the version number and build number of the installed client. It also contains a link to legal information.

Access the About Box by clicking the **About** icon near the top left corner of the **My Functions** tab.

The About Box is then displayed.

User Help

AMT is now installed with a PDF Help document (replacing the legacy .HLP document). Access the Help document from the main AMT window by either:

1. Pressing F1.
2. Clicking the Help icon near the top left corner of the My Functions tab.

A **PDF Viewer** must be installed in order to view the PDF Help file. We recommend the free **Adobe Acrobat Reader** application.

Issues Resolved

The following is a list of all issues resolved.

Functional Area	Description	Work Item
Client	Fixed an issue where it was necessary to refresh the **Standard Job** > **Price** tab after adding a part in order to see the price colour code.	14126
Client	Re-instated the **Create Blank Equipment - Centreline** and **Create Blank Equipment - Modelling** functions removed in release 8.12.	14329

Functional Area	Description	Work Item
Client	Fixed an issue with the **Export builder G3 Projections** wizard where the export would fail if the target file location did not exist.	14341
Client	Fixed an issue with the general filter control where, under certain conditions, the control would indicate a negative number of filters were selected. For example, **(-1/4) ***** should be **(3/4) *****	15276
Client	Fixed an issue where the password field of the login dialog was not cleared if authentication failed.	15875
Client	Fixed an issue where the mandatory field indicator was missing from the **Workorder Feedback** > **Cause** field.	17502
Client	Fixed an issue where clearing a strategy task description and saving the strategy task did not persist the clearing of the description.	18364
Client	Fixed an issue in **System Administrator** > **Parts Manager** where the Reference filter did not work as expected.	18545
Client	Fixed an issue in **Parts Warranty Export** where the process could fail silently if the sum of actual quantity values equalled zero.	20053
Client	Fixed errors in the **Work Group** function Tips text.	20274
Client	Fixed an issue where filtering in **Warranty** > **Warranty Approval** would not return the expected results.	21725
Client	Fixed an issue in the **Multi-Strategy Editor** where filtering for both planned and unplanned items would result in unexpected results.	21731
Client	Fixed an issue in **Standard Job Manager** where specifying specific filters could result in duplicate rows being returned.	21785
Client	Fixed an issue in **Work Order Settlement Manager** where selecting the **Linked to Equipment** filter would result in an error.	21788
Client	Fixed an issue when manually raising a Strategy Task work order, the Strategy Task containing a Unicode character in its name would result in an error.	21828
Client	Fixed various layout issues in the **External Downtime Wizard**.	21851

Functional Area	Description	Work Item
Client	Fixed various layout issues in the **Cost Accrual** > **Accrual Details** form.	21853
Client	Fixed various layout issues in the **MARC Billings** > **Billings** > **Actual Billings** form.	21855
Client	Fixed an issue with the **Generic Interface Log** where the incorrect line number could be display for import errors.	21889
Client	Fixed an issue with the **Edit Usage Profile** form where an error could occur after making a change to the monthly usage profile and refreshing the form.	21915
Client	Fixed an issue in the **Standard Job Manager** where applying a filter, closing, then reopening the form and applying the saved filter settings would result in an error.	22063
Client	Fixed an issue in the **Cost Occurrence Manager** where filtering on Site Fleet and Branch could cause an error to be raised.	22170
Client	Fixed an issue where opening some equipment that did not have an end date calculated would result in an error.	22384
Client	Fixed an issue where an error would occur when updating equipment that did not have an end date calculated.	22426
Client	Fixed an issue where columns were being duplicated in the **Component Changeout** grid.	22459
Client	Fixed an issue where clearing the end date on Equipment, not supplying a new date and saving the equipment would result in an error.	22512
Client	Removed the **Clear** button that was exposed in error on the **Actual Usage Details - Report Parameters** dialog, as clicking it would result in an error.	22603
Client	Fixed a permission issue in the **Multi-Task Editor** that would allow some users to see equipment they did not have permission to view.	22691
Client	Fixed an issue where the **Equipment Multi-editors** Quick Link option to the **Equipment Administration** form would open the old form.	22695
Client	Fixed an issue in the **Workorder Settlement Manager** where under certain circumstances display fields could become duplicated.	22738

Functional Area	Description	Work Item
Client	Fixed an issue where, under certain circumstances, some Strategy Tasks may not have a sales status.	22753
Client	Fixed an issue introduced in release 8.15 where five filters were missing from the **Workorder Schedule** tab.	22757
Client	Fixed an issue introduced in release 8.15 where **Long Term Planning** > **Fleet Condition** > **Edit Next Due** would incorrectly open the Strategy Editor.	22875
Client	Fixed an issue that could result in an error when deleting readings.	22893
Client	Fixed an issue where the **Strategy Task Manager Close** button did not display a tooltip.	22932
Client	Fixed an issue where the **Multi-Task Scope Editor Close** button did not display a tooltip.	22937
Client	Fixed several alignment issues in the **Multi-Task Scope Editor**.	22938
Client	Fixed an issue in the **Long Term Planning** form, where adding the **Rebuild Workorder Site** display field did not actually add the display field to the grid.	22788
Client	Fixed several issues in the **Strategy Task Editor** > **Scheduling** tab.	22692
Client	Fixed an issue in the **Editable Strategy Task Editor** where highlighting a cell by moving the cursor and pressing any digit key would cause an error.	23061
Client	With the **Dealer Customer Financial** mode active, the **Workorder Settlement** tab was hidden. Based on user feedback, the Settlement tab is now visible.	23239
Client	Fixed an issue in the **Settings** > **User Accounts** form where clicking in the accounts grid, if empty, would cause an exception error to occur.	23319
Client	Fixed a spelling mistake and refactored the **Distribution Code Form**.	23125
Billing	Fixed an issue where copying the **Billing Projection** to the same equipment would fail.	22550

Functional Area	Description	Work Item
Budgeting	Fixed an issue where a long scenario name would be truncated on the **Labour Hours Manager** dialog.	22184
Budgeting	Fixed an issue where the **Please Wait** message would not disappear on the **Labour Hour Manager** form.	22188
Budgeting	Fixed an issue where the **Clear Filter** button on the **Budget and Forecast Manger** dialog did not work.	22189
Budgeting	Fixed an issue in the **Budget Labour Hour Manager** dialog that could cause an error when only one row was returned in response to a filter being applied.	22217
Budgeting	Fixed a major performance problem associated with adding equipment to a budget.	22195
Equipment	Fixed an issue in the **Equipment** > **MARC** tax rates where the number of decimal places displayed could change.	21849
Equipment	Fixed an issue where equipment future costs were not always calculated when AMT was configured to use **Negative Accrual**.	22231
Planning	Fixed an issue where, under some situations, updating planning from strategy did not create work order settlements or auto-create work order settlement work orders.	23273
Quoter	Improved the performance of quote generation on AMT Mobile.	22120
Quoter	Fixed an issue where, in some cases, the Quoter generated end usage and date was incorrect.	23185
Strategy	Fixed an issue where it was not possible to **supersede a part** that existed only in a Strategy Task (and not in a Standard Job).	13069
Work orders	Fixed an issue where an error could be raised when modifying Task Types if the system types **ABAN/ABD** did not exist.	22351
Integration	Fixed an issue in the **Proposed Billings** interface where the **Start_Usage_Date_Time** field date format, as implemented, did not match the documented standard (**YYY-MM-DD hh:mm:ss**).	12818

Functional Area	Description	Work Item
Integration	Fixed an issue that could cause the **Populate Parts Usage from AMT Workorders** system task to fail.	21787
Integration	Fixed an issue where residual records in a temporary table could cause the Process Downtime Event Import Interface to fail.	22350
Integration	Fixed an issue with the **Import Customer** web service where the existing **Price Group** value in AMT would be reset to the default value if a NULL is sent (or the tag is completely omitted). This was contrary to the specification, which stated that the existing value will be left as "if " if a NULL or nil tag is sent.	22797
Mobile	Fixed formatting issues when entering values in the **Record Usages** form.	11521
Mobile	Increased the timeout between AMT Mobile and the server.	20980
Mobile	Fixed an issue where reports whose name contained a dash (-) would not have configuration automatically generated and would therefore crash when executed from Mobile.	21734
Mobile	Fixed an issue where the **Timesheet** module could throw exceptions when editing dates when used against certain Internet Explorer versions.	22365
Mobile	Fixed an issue where the **Request Authorisation** and **Confirm Authorisation** options were erroneously shown for Life Cycle Cost quotes.	22503
Mobile	Fixed an issue where filter selections were not being saved in offline mode.	23158
Mobile	Extended the **Workorder Editor** view to include asset details.	23199
Mobile	Fixed an issue in the **Inspection** view where minute values less than 10 had the leading zero truncated prior to display. For example, a time of 10:04 would be displayed as 10:4.	23226
Mobile	Fixed an issue where adding attachments to work orders in offline mode, then saving the work order would not save the attachment with the work order.	23256
Mobile	Extended the **Workorders List** view and the **Workorders Authorisation** view to include the work order description and number. **Priority** was also moved next to **Status**.	23272

Functional Area	Description	Work Item
Mobile	Added a filter for in-progress inspections to be shown only for the selected inspection type in offline mode.	23277
Mobile	Fixed an error where resuming an inspection, saving the inspection, changing the status of the associated work order, then resuming the inspection could result in an error.	23293
Mobile	Fixed an issue where some work orders could disappear from AMT Mobile when switching to offline mode.	23297
Mobile	Fixed an issue where saving a work order with a state that violated business rules would not provide any feedback to the user that the business rule had been violated.	23301
Mobile	Fixed an issue where the user would be presented with a blank screen, rather than the login screen, should the session time out.	23321
Mobile	Fixed an issue where creating a work order from a Standard Job linked to an Electronic Workscope Template that contained a long comment would result in an exception.	23385
Mobile	Fixed a validation issue with the **Select Inspection** view that could result in the view being left in an inconsistent state.	23406
Mobile	Fixed an issue where cached system data was not being properly managed when changing the filtering of attachments when going offline.	23416
Mobile	Fixed an issue where resuming an inspection, adding an attachment and saving the inspection would result in the incorrect inspection start time being displayed.	23419
Mobile	Fixed an issue where the site selector would not be shown after the user switches from online to offline mode.	23438
Reports	Fixed an issue where the **Daily Log Summary Report** could raise an error under specific circumstances.	13752
Reports	Fixed an issue where some text on the **Equipment Operational Performance Summary Report** was obscured.	15651
Reports	Fixed an issue where the **Change Analysis Report** did not offer the Bar Chart type option.	16709

Functional Area	Description	Work Item
Reports	Fixed an issue with the **Trending Report** where an error could occur if no filter options were supplied.	21383
Reports	Fixed text truncation issues in the **Workorder Settlement List Report**.	21673
Reports	Fixed an issue in the **Workorder Labour Analysis Report** where an error could occur if certain filter options were supplied.	21761
Reports	Fixed a running sum issue for Start Usage and End Usage in the **Asset Utilisation Report**	21981
Reports	Fixed an issue in the **Equipment Expiration Report** where the incorrect end date could be displayed.	22123
Reports	Fixed a performance issue in the **Cost per UOM per Interval Report**.	22168
Reports	Fixed an issue in the **PCV Analysis Report** where selecting too many component codes could result in an error.	22381
Reports	Fixed a performance issue in the **Cost per Interval - Modelling Report**.	22670
Reports	Fixed an issue in the **Customer Agreement Summary Report** where the Interval Cost Summary was not being filtered according to the Cost Bearer Filter.	22739
Reports	Fixed an issue in the **RVIC Analysis Report** where the last change prior to the equipment start date of the strategy task was not being considered.	22868
Reports	Fixed an issue in the **PCV Analysis Report** where the Strategy Task filters were excluding unassigned tasks while the report itself was including unassigned tasks.	23099
Reports	Fixed an issue in the **Long Term Planning Log Report** where filtering on branch did not restrict the Sites or Fleets that can be selected.	22690
Reports	Fixed an issue in the **Labour Hours Analysis Report** where an error could occur depending on the filtering criteria	21939
Reports	The Start and End Date filters in the **Timesheet Analysis Report** now default to the current date. Previously they defaulted to April 5, 2017.	22794
AMT Web	Fixed an issue in the **Inspections** > **Add Notification** view where the Cancel button did not do anything.	21720

License Information

AMT does not require any other RPM-specific product licenses to use this version of the software.
