Asset Management Framework

INTRODUCTION

The Asset Management Policy and Guidelines define how Glencore Copper manages the **whole of life of an asset** to ensure optimal value is extracted by ensuring that assets are capable of meeting business and stakeholder objectives.

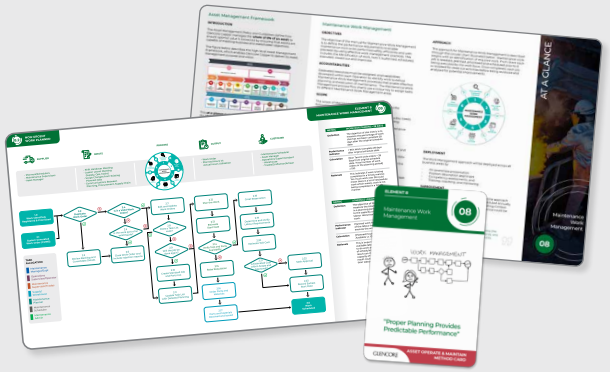

The figure below describes the high-level Asset Management Framework, which enables Glencore Copper to deliver its Asset Management purpose and vision.

This **at a glance summary** is designed to be an introduction to the **Maintenance Work Management Manual** which is one of 18 elements within the Asset Management Framework.

The framework is introduced using a suite of tailored documents. The **method card** is designed to generate thought and discussion around work management. This **at a glance summary** introduces maintenance work management, its objectives, approach, deployment and measures of success. The subsequent **process flow charts** provide a detailed step by step description of how to execute work management.

These documents are deliberately simple and easy to read and can be used as **communication tools** to share leading practice work management. Each element has its own method card, at a glance summary and process flow charts.

Maintenance Work Management

OBJECTIVES

The objective of the manual for Maintenance Work Management is to define the performance requirements to enable maintenance work to be performed safely, efficiently and with precision by using effective work management practices. This includes the identification of work, how it is planned, scheduled, executed, closed out and improved.

ACCOUNTABILITIES

Dedicated resources must be assigned, and capabilities developed within each Operation to identify work to deliver Maintenance Work Management processes that enable effective planning, and execution of maintenance. The Maintenance Work Management process flow charts use a colour key to assign tasks to different Maintenance Work Management areas.

SCOPE

The scope of Maintenance Work Management covers the following:

- All maintenance work activities to be entered into the CMMS
- Maintenance Work Management activities including:
  - Glencore owned and operated equipment
  - Work triggered by equipment defined maintenance strategies
  - Reliability of maintainable objects and defect elimination
  - Logging of history and statutory or legislative requirements
  - Plant spares requisitioned from the Procurement and Supply Chain
- Mechanisms that support the correct entry of master data including:
  - Establishing and maintaining Resource Work Centre capacities that reflect resource availability
  - Establishing maintenance items, maintenance strategies and work plans
  - Establishing task lists that cover all aspects of the task from preparation to completion

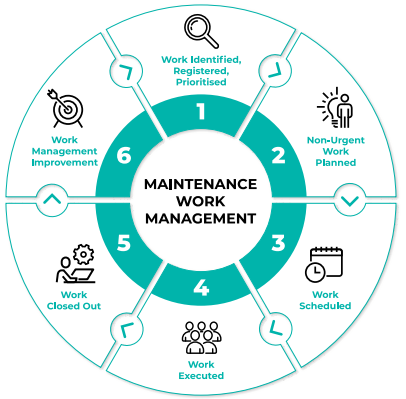

MEASURES

Performance must be measured for each operation against the Maintenance Work Management Key Performance Indicators to ensure compliance with business processes.

The relevant Maintenance Work Management performance indicators are described within each process flow chart. Also refer to Glencore Copper's AM Guideline E16 Reporting and Performance Management Guideline for current KPI's.

APPROACH

The approach for Maintenance Work Management is described through the circular chart illustrated below. Maintenance work begins with an identification of required work. From there each job is released, planned, prioritised and scheduled prior to it being executed by the work force. Once completed, each job is revisited for close out activities before being reviewed and analysed for potential improvements.

DEPLOYMENT

The Work Management approach will be deployed across all business areas by:

- An awareness presentation
- Position description alignment
- Competency assessments, and
- Training, coaching, and mentoring

IMPROVEMENT

The process to review and continually improve the approach and deployment for Work Management is scheduled annually, or when there is a sudden change in the Operating Context. As the organization matures a longer review period could be considered.
